**S3C2451**  
**16/32-Bit RISC Microprocessor**

**March 2009**

**REV 1.10**

# Important Notice

The information in this publication has been carefully checked and is believed to be entirely accurate at the time of publication. Samsung assumes no responsibility, however, for possible errors or omissions, or for any consequences resulting from the use of the information contained herein.

Samsung reserves the right to make changes in its products or product specifications with the intent to improve function or design at any time and without notice and is not required to update this documentation to reflect such changes.

This publication does not convey to a purchaser of semiconductor devices described herein any license under the patent rights of Samsung or others.

Samsung makes no warranty, representation, or guarantee regarding the suitability of its products for any particular purpose, nor does Samsung assume any liability arising out of the application or use of any product or circuit and specifically disclaims any and all liability, including without limitation any consequential or incidental damages.

"Typical" parameters can and do vary in different applications. All operating parameters, including "Typicals" must be validated for each customer application by the customer's technical experts.

Samsung products are not designed, intended, or authorized for use as components in systems intended for surgical implant into the body, for other applications intended to support or sustain life, or for any other application in which the failure of the Samsung product could create a situation where personal injury or death may occur.

Should the Buyer purchase or use a Samsung product for any such unintended or unauthorized application, the Buyer shall indemnify and hold Samsung and its officers, employees, subsidiaries, affiliates, and distributors harmless against all claims, costs, damages, expenses, and reasonable attorney fees arising out of, either directly or indirectly, any claim of personal injury or death that may be associated with such unintended or unauthorized use, even if such claim alleges that Samsung was negligent regarding the design or manufacture of said product.

# NOTIFICATION OF REVISIONS

**ORIGINATOR:** Samsung Electronics, LSI Development Group, Gi-Heung, South Korea

**PRODUCT NAME:** S3C2451 RISC Microprocessor

**DOCUMENT NAME:** S3C2451 User's Manual, Revision 1.10

**DOCUMENT NUMBER:** 21.10-S3-C2450-082008

**EFFECTIVE DATE:** March, 2009

**DIRECTIONS:** Revision 1.10

## REVISION HISTORY

| Revision No | Description of Change                                   | Refer to | Author(s)    | Date             |
|-------------|---|----------|--------------|------------------|
| 1.00        | - Initial Release                                       | -        | AP app part. | January 05, 2008 |
| 1.10        | LCD Controller, SMC, HSSPI, Electrical data are updated | -        | AP app part. | March 10, 2009   |

## REVISION DESCRIPTIONS FOR REVISION 1.10

| Chapter             |       | Subjects (Major changes comparing with last version)          |
|---------------------|-------|---|
| Chapter Name        | Page  |   |
| 5. SMC              | 5-6   | Removed ASYNCHRONOUS BURST READ chapter(including Figure 5-6) |
| 20. HS-SPI          | 20-5  | Added EXTERNAL LOADING CAPACITANCE chapter                    |
| 22. LCD CONTROLLER  | 22-19 | Modified VD pin descriptions at 16BPP CPU Interface.          |
| 22. LCD CONTROLLER  | 22-50 | Modified SYS_CS1_CON / SYS_CS0_CON bit locations.             |
| 29. ELECTRICAL DATA | 29-2  | Modified DC Supply Voltage for RTC Max value.                 |
| 29. ELECTRICAL DATA | 29-3  | Modified DC Supply Voltage for RTC Max value.                 |

# Table of Contents

## Chapter 1 Product Overview

|   |      |
|---|------|
| 1 Introduction .....  | 1-1  |
| 2 Features .....  | 1-2  |
| 3 Block Diagram.....  | 1-5  |
| 4 Pin Assignments .....   | 1-6  |
| 4.1 Signal Descriptions.....                                      | 1-24 |
| 4.2 S3C2451 Operation Mode Description .....                      | 1-31 |
| 4.3 S3C2451 Memory MAP and Base Address of Special Registers..... | 1-32 |

## Chapter 2 System Controller

|   |      |
|---|------|
| 1 Overview .....  | 2-1  |
| 2 Feature.....  | 2-1  |
| 3 Block Diagram.....  | 2-2  |
| 4 Functional Descriptions.....  | 2-3  |
| 4.1 Reset Management and Types .....  | 2-3  |
| 4.2 Hardware Reset.....   | 2-3  |
| 4.3 Watchdog Reset .....  | 2-4  |
| 4.4 Software Reset.....   | 2-5  |
| 4.5 Wakeup Reset.....   | 2-5  |
| 5 Clock Management.....   | 2-6  |
| 5.1 Clock Generation Overview.....  | 2-6  |
| 5.2 Clock Source Selection .....  | 2-6  |
| 5.3 PLL (Phase-Locked-Loop) .....   | 2-8  |
| 5.4 Change PLL Settings In Normal Operation.....  | 2-8  |
| 5.5 System Clock Control.....   | 2-9  |
| 5.6 ARM & BUS Clock Divide Ratio .....  | 2-10 |
| 5.7 Examples for configuring clock register to produce specific frequency of AMBA clocks..... | 2-11 |
| 5.8 ESYSCLK Control .....   | 2-12 |
| 6 Power Management.....   | 2-13 |
| 6.1 Power Mode State Diagram .....  | 2-13 |
| 6.2 Power Saving Modes.....   | 2-14 |
| 6.3 Wake-Up Event .....   | 2-19 |
| 6.4 Output Port State and STOP and SLEEP Mode .....   | 2-19 |
| 6.5 Power Saving Mode Entering/Exiting Condition.....   | 2-20 |
| 7 Register Descriptions.....  | 2-21 |
| 7.1 Address Map .....   | 2-21 |

# Table of Contents (Continued)

## Chapter 2 System Controller (Continued)

|  |      |
|--|------|
| 8 Individual Register Descriptions.....  | 2-22 |
| 8.1 Clock Source Control Registers<br>(LOCKCON0, LOCKCON1, OSCSET, MPLLCON, and EPLLCON) ..... | 2-22 |
| 8.2 Clock Control Register (CLKSRC, CLKDIV, HCLKCON, PCLKCON, and SCLKCON).....                | 2-25 |
| 8.3 Power Management Registers (PWRMODE and PWRCFG) .....                                      | 2-31 |
| 8.4 Reset Control Registers (SWRST and RSTCON).....  | 2-33 |
| 8.5 Control of retention PAD(I/O) when normal mode and wake-up from sleep mode .....           | 2-34 |
| 8.6 System Controller Status Registers (WKUPSTAT and RSTSTAT).....                             | 2-35 |
| 8.7 Bus Configuration Register (BUSPRI0, BUSPRI1, and BUSMISC).....                            | 2-36 |
| 8.8 Information Register 0,1,2,3 .....   | 2-37 |
| 8.9 USB PHY Control register (PHYCTRL) .....   | 2-38 |
| 8.10 USB PHY Power Control Register (PHYPWR) .....   | 2-39 |
| 8.11 USB Reset Control Register (URSTCON).....   | 2-39 |
| 8.12 USB Clock Control Register (UCLKCON) .....  | 2-40 |

## Chapter 3 Bus Matrix & EBI

|  |     |
|--|-----|
| 1 Overview.....  | 3-1 |
| 2 Special Function Registers .....                     | 3-2 |
| 2.1 Matrix Core 0 Priority Register (Bpriority0) ..... | 3-2 |
| 2.2 Matrix Core 1 Priority Register (Bpriority1) ..... | 3-2 |
| 2.3 EBI Control Register (EBICON).....                 | 3-3 |

## Chapter 4 Bus Priorities

|                            |     |
|----------------------------|-----|
| 1 Overview.....            | 4-1 |
| 1.1 Bus Priority MAP ..... | 4-1 |

## Table of Contents (Continued)

### Chapter 5 Static Memory Controller (SMC)

|   |      |
|---|------|
| 1 Overview .....  | 5-1  |
| 2 Feature .....   | 5-2  |
| 3 Block Diagram.....  | 5-3  |
| 3.1 Asynchronous Read .....                                       | 5-4  |
| 3.2 Synchronous Read/Synchronous Burst Read.....                  | 5-6  |
| 3.3 Asynchronous Write .....                                      | 5-7  |
| 3.4 Synchronous Write/ Synchronous Burst Write .....              | 5-9  |
| 3.5 Bus Turnaround.....   | 5-10 |
| 4 Special Registers .....   | 5-13 |
| 4.1 Bank Idle Cycle Control Registers 0-5 .....                   | 5-13 |
| 4.2 Bank Read Wait State Control Registers 0-5.....               | 5-13 |
| 4.3 Bank Write Wait State Control Registers 0-5 .....             | 5-14 |
| 4.4 Bank Output Enable Assertion Delay Control Registers 0-5..... | 5-14 |
| 4.5 Bank Write Enable Assertion Delay Control Registers 0-5 ..... | 5-15 |
| 4.6 Bank Control Registers 0-5 .....                              | 5-16 |
| 4.7 Bank Onenand Type Selection Register .....                    | 5-18 |
| 4.8 SMC Status Register .....                                     | 5-18 |
| 4.9 SMC Control Register.....                                     | 5-19 |

### Chapter 6 Mobile DRAM Controller

|   |      |
|---|------|
| 1 Overview .....  | 6-1  |
| 2 Block Diagram.....  | 6-2  |
| 3 Mobile DRAM Initialization Sequence.....                        | 6-3  |
| 3.1 Mobile DRAM(SDRAM or mobile DDR) Initialization Sequence..... | 6-3  |
| 3.2 DDR2 Initialization Sequence.....                             | 6-3  |
| 3.3 Mobile DRAM Configuration Register .....                      | 6-8  |
| 3.4 Mobile DRAM Control Register .....                            | 6-9  |
| 3.5 Mobile DRAM Timming Control Register .....                    | 6-10 |
| 3.6 Mobile DRAM (Extended ) Mode Register Set Register.....       | 6-11 |
| 3.7 Mobile DRAM Refresh Control Register .....                    | 6-14 |
| 3.8 Mobile DRAM Write Buffer Time out Register.....               | 6-14 |

## Table of Contents (Continued)

### Chapter 7 NAND Flash Controller

|  |      |
|--|------|
| 1 Overview.....  | 7-1  |
| 2 Features .....   | 7-1  |
| 3 Block Diagram .....                                      | 7-2  |
| 4 Boot Loader Function .....                               | 7-2  |
| 5 GPC5/6/7 Pin Configuration Table in IROM Boot Mode ..... | 7-3  |
| 6 NAND Flash Memory Timing .....                           | 7-3  |
| 7 NAND Flash Access.....                                   | 7-4  |
| 8 Data Register Configuration.....                         | 7-5  |
| 9 Steppingstone (8KB in 64KB SRAM) .....                   | 7-5  |
| 10 1bit / 4bit / 8bit ECC (Error Correction Code) .....    | 7-5  |
| 10.1 ECC Module Features .....                             | 7-5  |
| 10.2 1-bit ECC Programming Encoding and Decoding .....     | 7-7  |
| 10.3 4-bit ECC Programming Guide (ENCODING).....           | 7-7  |
| 10.4 4-bit ECC Programming Guide (DECODING).....           | 7-8  |
| 10.5 8-bit ECC Programming Guide (ENCODING).....           | 7-8  |
| 10.6 8-bit ECC Programming Guide (DECODING).....           | 7-9  |
| 11 Memory Mapping(NAND boot and Other boot).....           | 7-10 |
| 12 NAND Flash Memory Configuration.....                    | 7-11 |
| 13 NAND Flash Controller Special Registers .....           | 7-12 |
| 13.1 NAND Flash Controller Register Map.....               | 7-12 |
| 13.2 Nand Flash Configuration Register .....               | 7-13 |
| 13.3 Control Register.....                                 | 7-15 |
| 13.4 Command Register .....                                | 7-17 |
| 13.5 Address Register .....                                | 7-17 |
| 13.6 Data Register .....                                   | 7-17 |
| 13.7 Main Data area ECC Register .....                     | 7-18 |
| 13.8 Spare area ECC Register .....                         | 7-18 |
| 13.9 Progrmmable Block Address Register.....               | 7-19 |
| 13.10 NFFCON Status Register .....                         | 7-21 |
| 13.11 ECC0/1 Error Status Register.....                    | 7-22 |
| 13.12 Main Data Area ECC0 Status Register .....            | 7-24 |
| 13.13 Spare Area ECC Status Register .....                 | 7-25 |
| 13.14 4-bit ECC Error Patten Register .....                | 7-25 |
| 13.15 ECC 0/1/2 for 8bit ECC Status Register.....          | 7-26 |
| 13.16 8bit ECC Main Data ECC 0/1/2/3 Status Register.....  | 7-27 |
| 13.17 8bit ECC Error Pattern Register .....                | 7-28 |

## Table of Contents (Continued)

### Chapter 8 CF Controller

|   |      |
|---|------|
| 1 Overview .....                                  | 8-1  |
| 1.1 Features.....                                 | 8-1  |
| 1.2 Signal description .....                      | 8-2  |
| 1.3 Block Diagram .....                           | 8-3  |
| 1.4 Timing Diagram .....                          | 8-6  |
| 1.5 Special Function Registers.....               | 8-8  |
| 2 Individual Register Descriptions .....          | 8-11 |
| 2.1 MUX_REG Register .....                        | 8-11 |
| 2.2 PCCARD Configuration & Status Register.....   | 8-12 |
| 2.3 PCCARD Interrupt Mask & Source Register ..... | 8-13 |
| 2.4 PCCARD_ATTR Register .....                    | 8-14 |
| 2.5 PCCARD_I/O Register .....                     | 8-14 |
| 2.6 PCCARD_COMM Register .....                    | 8-15 |
| 2.7 ATA_CONTROL Register .....                    | 8-16 |
| 2.8 ATA_STATUS Register .....                     | 8-16 |
| 2.9 ATA_COMMAND Register .....                    | 8-17 |
| 2.10 ATA_SWRST Register .....                     | 8-18 |
| 2.11 ATA_IRQ Register.....                        | 8-18 |
| 2.12 ATA_IRQ_MASK Register .....                  | 8-19 |
| 2.13 ATA_CFG Register.....                        | 8-20 |
| 2.14 ATA_PIO_TIME Register .....                  | 8-22 |
| 2.15 ATA_XFR_NUM Register.....                    | 8-22 |
| 2.16 ATA_XFR_CNT Register .....                   | 8-22 |
| 2.17 ATA_TBUF_START Register.....                 | 8-23 |
| 2.18 ATA_TBUF_SIZE Register.....                  | 8-23 |
| 2.19 ATA_SBUF_START Register.....                 | 8-24 |
| 2.20 ATA_SBUF_SIZE Register .....                 | 8-24 |
| 2.21 ATA_CADDR_TBUF Register.....                 | 8-25 |
| 2.22 ATA_CADDR_SBUF Register.....                 | 8-25 |
| 2.23 ATA_PIO_DTR Register .....                   | 8-25 |
| 2.24 ATA_PIO_FED Register.....                    | 8-26 |
| 2.25 ATA_PIO_SCR Register .....                   | 8-26 |
| 2.26 ATA_PIO_LLRR Register .....                  | 8-26 |
| 2.27 ATA_PIO_LMR Register .....                   | 8-27 |
| 2.28 ATA_PIO_LMR Register .....                   | 8-27 |
| 2.29 ATA_PIO_DVR Register .....                   | 8-27 |
| 2.30 ATA_PIO_CSD Register .....                   | 8-28 |
| 2.31 ATA_PIO_DAD Register .....                   | 8-28 |
| 2.32 ATA_PIO_RDATA Register.....                  | 8-28 |
| 2.33 BUS_FIFO_STATUS Register .....               | 8-29 |
| 2.34 ATA_FIFO_STATUS Register.....                | 8-29 |

## Table of Contents (Continued)

### Chapter 9 DMA Controller

|   |      |
|---|------|
| 1 Overview.....   | 9-1  |
| 2 DMA Request Sources.....                                  | 9-2  |
| 3 DMA Operation.....  | 9-3  |
| 3.1 External DMA Dreq/Dack Protocol .....                   | 9-4  |
| 3.2 Examples of Possible Cases .....                        | 9-7  |
| 4 DMA Special Registers .....                               | 9-8  |
| 4.1 DMA Initial Source Register (DISRC).....                | 9-8  |
| 4.2 DMA Initial Source Control Register (DISRCC).....       | 9-9  |
| 4.3 DMA Initial Destination Register (DIDST).....           | 9-10 |
| 4.4 DMA Initial Destination Control Register (DIDSTC) ..... | 9-11 |
| 4.5 DMA Control Register (DCON).....                        | 9-12 |
| 4.6 DMA Status Register (DSTAT).....                        | 9-14 |
| 4.7 DMA Current Source Register (DCSRC).....                | 9-15 |
| 4.8 Current Destination Register (DCDST) .....              | 9-15 |
| 4.9 DMA Mask Trigger Register (DMASKTRIG) .....             | 9-16 |
| 4.10 DMA Request Selection Register (DMAREQSEL).....        | 9-17 |

### Chapter 10 Interrupt Controller

|   |       |
|---|-------|
| 1 Overview.....                                     | 10-1  |
| 1.1 Interrupt Controller Operation .....            | 10-3  |
| 1.2 Interrupt Sources .....                         | 10-4  |
| 1.3 Interrupt Priority Generating Block.....        | 10-6  |
| 1.4 Interrupt Priority .....                        | 10-7  |
| 2 Interrupt Controller Special Registers .....      | 10-8  |
| 2.1 Source Pending (SRCPND) Register .....          | 10-10 |
| 2.2 Interrupt Mode (INTMOD) Register .....          | 10-12 |
| 2.3 Interrupt Mask (INTMSK) Register .....          | 10-14 |
| 2.4 Interrupt Pending (INTPND) Register .....       | 10-16 |
| 2.5 Interrupt Offset (INTOFFSET) Register.....      | 10-18 |
| 2.6 Sub Source Pending (SUBSRCPND) Register .....   | 10-20 |
| 2.7 Interrupt Sub Mask (INTSUBMSK) Register .....   | 10-22 |
| 2.8 Priority Mode Register (priority_MODE) .....    | 10-24 |
| 2.9 Priority Update Register (priority_UPDATE)..... | 10-29 |

## Table of Contents (Continued)

### Chapter 11 I/O Ports

|  |       |
|--|-------|
| 1 Overview .....   | 11-1  |
| 2 Port Control Descriptions .....                                    | 11-9  |
| 2.1 Port Configuration Register (GPACON-GPMCON) .....                | 11-9  |
| 2.2 Port Data Register (GPADAT-GPMDAT) .....                         | 11-9  |
| 2.3 Port Pull-Up/Down Register (GPBUDP-GPMUDP).....                  | 11-9  |
| 2.4 Miscellaneous Control Register.....                              | 11-9  |
| 2.5 External Interrupt Control Register.....                         | 11-9  |
| 3 I/O Port Control Register.....                                     | 11-10 |
| 3.1 PORT A Control Registers (GPACON, GPADAT) .....                  | 11-10 |
| 3.2 PORT B Control Registers (GPBCON, GPBDAT, GPBUDP, GPBSEL) .....  | 11-12 |
| 3.3 PORT C Control Registers (GPCCON, GPCDAT, GPCUDP) .....          | 11-14 |
| 3.4 PORT D Control Registers (GPDCON, GPDDAT, GPDUDP) .....          | 11-16 |
| 3.5 PORT E Control Registers (GPECON, GPEDAT, GPEUDP, GPESEL) .....  | 11-18 |
| 3.6 PORT F Control Registers (GPFCON, GPFDAT, GPFUDP).....           | 11-20 |
| 3.7 PORT G Control Registers (GPGCON, GPGDAT, GPGUDP) .....          | 11-21 |
| 3.8 PORT H Control Registers (GPHCON, GPHDAT, GPHUDP) .....          | 11-23 |
| 3.9 PORT J Control Registers (GPJCON, GPJDAT, GPJUDP, GPJSEL) .....  | 11-25 |
| 3.10 PORT K Control Registers (GPKCON, GPKDAT, GPKUDP).....          | 11-27 |
| 3.11 PORT L Control Registers (GPLCON, GPLDAT, GPLUDP, GPLSEL) ..... | 11-29 |
| 3.12 PORT M Control Registers (GPMCON, GPMDAT, GPMUDP) .....         | 11-31 |
| 3.13 Miscellaneous Control Register (MISCCR).....                    | 11-32 |
| 3.14 DCLK Control Registers (DCLKCON).....                           | 11-34 |
| 3.15 EXTINTn (External Interrupt Control Register n) .....           | 11-35 |
| 3.16 EINTFLTn (External Interrupt Filter Register n) .....           | 11-40 |
| 3.17 EINTMASK (External Interrupt Mask Register).....                | 11-41 |
| 3.18 EINTPEND (External Interrupt Pending Register) .....            | 11-42 |
| 3.19 GSTATUSn (General Status Registers).....                        | 11-43 |
| 3.20 DSCn (Drive Strength Control).....                              | 11-44 |
| 3.21 PDDMCON (Power Down SDRAM Control Register).....                | 11-48 |
| 3.22 PDSMCON (Power Down SRAM Control Register) .....                | 11-49 |
| 4 GPIO Alive & Sleep Part .....                                      | 11-51 |

## Table of Contents (Continued)

### Chapter 12 WatchDog Timer

|  |      |
|--|------|
| 1 Overview.....                                  | 12-1 |
| 1.1 Features.....                                | 12-1 |
| 2 Watchdog Timer Operation.....                  | 12-2 |
| 2.1 Block Diagram.....                           | 12-2 |
| 2.2 WTDAT & WTCNT.....                           | 12-2 |
| 2.3 Consideration of Debugging Environment.....  | 12-3 |
| 3 Watchdog Timer Special Registers.....          | 12-4 |
| 3.1 Watchdog Timer Control (WTCNT) Register..... | 12-4 |
| 3.2 Watchdog Timer Data (WTDAT) Register.....    | 12-5 |
| 3.3 Watchdog Timer Count (WTCNT) Register.....   | 12-5 |

### Chapter 13 PWM Timer

|   |       |
|---|-------|
| 1 Overview.....   | 13-1  |
| 1.1 Feature.....  | 13-1  |
| 2 PWM Timer Operation.....  | 13-3  |
| 2.1 Prescaler & Divider.....  | 13-3  |
| 2.2 Basic Timer Operation.....  | 13-4  |
| 2.3 Auto Reload & Double Buffering.....   | 13-5  |
| 2.4 Timer Initialization Using Manual Update Bit and Inverter Bit.....            | 13-6  |
| 2.5 Timer Operation.....  | 13-7  |
| 2.6 Pulse Width Modulation (PWM).....   | 13-8  |
| 2.7 Output Level Control.....   | 13-9  |
| 2.8 DEAD Zone Generator.....  | 13-10 |
| 2.9 DMA Request Mode.....   | 13-11 |
| 3 PWM Timer Control Registers.....  | 13-12 |
| 3.1 Timer Configuration Register0 (TCFG0).....                                    | 13-12 |
| 3.2 Timer Configuration Register1 (TCFG1).....                                    | 13-13 |
| 3.3 Timer Control (TCNT) Register.....  | 13-14 |
| 3.4 Timer 0 Count Buffer Register & Compare Buffer Register (TCNTB0/TCMPB0).....  | 13-16 |
| 3.5 Timer 0 Count Observation Register (TCNTO0).....                              | 13-16 |
| 3.6 Timer 1 Count Buffer Register & Compare Buffer Register (TCNTB1/TCMPB1).....  | 13-17 |
| 3.7 Timer 1 Count Observation Register (TCNTO1).....                              | 13-17 |
| 3.8 Timer 2 Count Buffer Register & Compare Buffer Register (TCNTB2/TCMPB2).....  | 13-18 |
| 3.9 Timer 2 Count Observation Register (TCNTO2).....                              | 13-18 |
| 3.10 Timer 3 Count Buffer Register & Compare Buffer Register (TCNTB3/TCMPB3)..... | 13-19 |
| 3.11 Timer 3 Count Observation Register (TCNTO3).....                             | 13-19 |
| 3.12 Timer 4 Count Buffer Register (TCNTB4).....                                  | 13-20 |
| 3.13 Timer 4 Count Observation Register (TCNTO4).....                             | 13-20 |

## Table of Contents (Continued)

### Chapter 14 Real Time Clock (RTC)

|   |      |
|---|------|
| 1 Overview .....                                | 14-1 |
| 1.1 Features.....                               | 14-1 |
| 1.2 Real Time Clock Operation Description ..... | 14-2 |
| 1.3 External Interface .....                    | 14-6 |
| 1.4 Register Description .....                  | 14-7 |
| 1.5 Individual Register Descriptions .....      | 14-8 |

### Chapter 15 UART

|  |       |
|--|-------|
| 1 Overview .....   | 15-1  |
| 1.1 Features.....  | 15-1  |
| 2 Block Diagram.....   | 15-2  |
| 2.1 UART Operation .....   | 15-3  |
| 3 UART Special Registers .....   | 15-12 |
| 3.1 UART Line Control Register .....                                       | 15-12 |
| 3.2 UART Control Register.....   | 15-13 |
| 3.3 UART FIFO Control Register .....                                       | 15-15 |
| 3.4 UART Modem Control Register.....                                       | 15-16 |
| 3.5 UART Tx/Rx Status Register .....                                       | 15-17 |
| 3.6 UART Error Status Register .....                                       | 15-18 |
| 3.7 UART FIFO Status Register .....  | 15-19 |
| 3.8 UART Modem Status Register .....                                       | 15-20 |
| 3.9 UART Transmit BUffer register (Holding Register & FIFO Register) ..... | 15-21 |
| 3.10 UART Receive BUffer Register (Holding Register & FIFO Register) ..... | 15-21 |
| 3.11 UART Baud RATE Divisor Register .....                                 | 15-22 |
| 3.12 UART Dividing Slot Register .....                                     | 15-23 |

### Chapter 16 USB Host Controller

|   |      |
|---|------|
| 1 Overview .....                                | 16-1 |
| 1.1 USB Host Controller Special Registers ..... | 16-2 |

## Table of Contents (Continued)

### Chapter 17 USB 2.0 Function

|   |       |
|---|-------|
| 1 Overview.....   | 17-1  |
| 1.1 Feature.....  | 17-1  |
| 2 Block Diagram.....  | 17-2  |
| 3 To Activate USB Port1 for USB 2.0 Function.....             | 17-3  |
| 4 SIE (Serial Interface Engine).....                          | 17-4  |
| 5 UPH (Universal Protocol Handler).....                       | 17-4  |
| 6 UTMI (USB 2.0 Transceiver Macrocell Interface).....         | 17-4  |
| 7 USB 2.0 Function Controller Special Registers.....          | 17-5  |
| 8 Registers.....  | 17-7  |
| 8.1 Index Register (IR).....                                  | 17-7  |
| 8.2 Endpoint Interrupt Register (EIR).....                    | 17-8  |
| 8.3 Endpoint Interrupt Enable Register (EIER).....            | 17-9  |
| 8.4 Function Address Register (FAR).....                      | 17-10 |
| 8.5 ENdpoint Direction Register (EDR).....                    | 17-11 |
| 8.6 Test Register (TR).....                                   | 17-12 |
| 8.7 System Status Register (SSR).....                         | 17-13 |
| 8.8 System Control Register (SCR).....                        | 17-15 |
| 8.9 EP0 Status Register (EP0SR).....                          | 17-16 |
| 8.10 EP0 Control Register (EP0CR).....                        | 17-17 |
| 8.11 Endpoint# Buffer Register (EP#BR).....                   | 17-18 |
| 8.12 Endpoint Status Register (ESR).....                      | 17-19 |
| 8.13 Endpoint Control Register (ECR).....                     | 17-21 |
| 8.14 Byte read Count Register (BRCR).....                     | 17-22 |
| 8.15 Byte Write Count Register (BWCR).....                    | 17-23 |
| 8.16 MAX Packet Register (MPR).....                           | 17-24 |
| 8.17 DMA Control Register (DCR).....                          | 17-25 |
| 8.18 DMA Transfer Counter Register (DTCR).....                | 17-26 |
| 8.19 DMA FIFO Counter Register (DFCR).....                    | 17-27 |
| 8.20 DMA Total Transfer Counter Register 1/2 (DTTCR 1/2)..... | 17-28 |
| 8.21 DMA Interface Control Register (DICR).....               | 17-29 |
| 8.22 Memory Base Address Register (MBAR).....                 | 17-30 |
| 8.23 Memory Current Address Register (MCAR).....              | 17-31 |
| 8.24 Burst FIFO Control Register(FCON).....                   | 17-31 |
| 8.25 Burst FIFO Status Register(FSTAT).....                   | 17-31 |
| 8.26 AHB Master(DMA) Operation Flow Chart.....                | 17-32 |

## Table of Contents (Continued)

### Chapter 18 IIC-Bus Interface

|   |       |
|---|-------|
| 1 Overview .....  | 18-1  |
| 1.1 IIC-Bus Interface.....  | 18-3  |
| 1.2 Start And Stop Conditions .....   | 18-3  |
| 1.3 Data Transfer Format .....  | 18-4  |
| 1.4 ACK Signal Transmission.....  | 18-5  |
| 1.5 Read-Write Operation.....   | 18-6  |
| 1.6 Bus Arbitration Procedures .....  | 18-6  |
| 1.7 Abort Conditions .....  | 18-6  |
| 1.8 Configuring IIC-Bus .....   | 18-6  |
| 1.9 Flowcharts of Operations in Each Mode .....                             | 18-7  |
| 2 IIC-Bus Interface Special Registers.....                                  | 18-11 |
| 2.1 Multi-Master IIC-Bus Control (IICCON) Register .....                    | 18-11 |
| 2.2 Multi-Master IIC-Bus Control/Status (IICSTAT) Register .....            | 18-12 |
| 2.3 Multi-Master IIC-Bus Address (IICADD) Register .....                    | 18-13 |
| 2.4 Multi-Master IIC-Bus Transmit/Receive Data Shift (IICDS) Register ..... | 18-13 |
| 2.5 Multi-Master IIC-Bus Line Control(IICLC) Register .....                 | 18-14 |

### Chapter 19 2D

|                                       |       |
|---------------------------------------|-------|
| 1 Introduction .....                  | 19-1  |
| 1.1 Features.....                     | 19-1  |
| 2 Color Format Conversion.....        | 19-2  |
| 3 Command FIFO .....                  | 19-3  |
| 4 Rendering Pipeline.....             | 19-4  |
| 4.1 Primitive Drawing.....            | 19-4  |
| 4.2 Rotation .....                    | 19-9  |
| 4.3 Clipping.....                     | 19-11 |
| 4.4 Stencil Test.....                 | 19-11 |
| 4.5 Raster Operation .....            | 19-11 |
| 4.6 Alpha Blending .....              | 19-13 |
| 5 Register Descriptions.....          | 19-14 |
| 5.1 General Registers.....            | 19-16 |
| 5.2 Command Registers.....            | 19-19 |
| 5.3 Parameter Setting Registers ..... | 19-21 |

## Table of Contents (Continued)

### Chapter 20 HS\_SPI Controller

|   |      |
|---|------|
| 1 Overview.....   | 20-1 |
| 2 Features .....  | 20-1 |
| 3 Signal Descriptions.....                              | 20-2 |
| 4 Operation.....  | 20-2 |
| 4.1 Operation Mode .....                                | 20-3 |
| 4.2 FIFO Access .....                                   | 20-3 |
| 4.3 Trailing Bytes in the Rx FIFO.....                  | 20-3 |
| 4.4 Packet Number Control .....                         | 20-3 |
| 4.5 NCS Control.....                                    | 20-3 |
| 4.6 HS_SPI Transfer Format .....                        | 20-4 |
| 5 External Loading Capacitance .....                    | 20-5 |
| 6 Special Function Register Descriptions .....          | 20-5 |
| 6.1 Setting Sequence of Special Function Register ..... | 20-5 |
| 6.2 Special Function Register.....                      | 20-6 |

### Chapter 21 SD/MMC Host Controller

|  |       |
|--|-------|
| 1 Overview.....  | 21-1  |
| 2 Features .....   | 21-1  |
| 3 Block Diagram .....  | 21-2  |
| 4 Sequence .....   | 21-3  |
| 4.1 SD Card Detection Sequence.....                              | 21-3  |
| 4.2 SD Clock Supply Sequence.....                                | 21-4  |
| 4.3 SD Clock Stop Sequence .....                                 | 21-5  |
| 4.4 SD Clock Frequency Change Sequence.....                      | 21-5  |
| 4.5 SD Bus Power Control Sequence.....                           | 21-6  |
| 4.6 Change Bus Width Sequence.....                               | 21-7  |
| 4.7 Timeout Setting for DAT Line .....                           | 21-8  |
| 4.8 SD Transaction Generation .....                              | 21-8  |
| 4.9 SD Command Issue Sequence .....                              | 21-9  |
| 4.10 Command Complete Sequence.....                              | 21-10 |
| 4.11 Transaction Control with Data Transfer Using DAT Line ..... | 21-12 |
| 4.12 Abort Transaction.....                                      | 21-16 |
| 5 SDI Special Registers .....                                    | 21-17 |
| 5.1 Configuration Register Types .....                           | 21-17 |
| 5.2 SDMA System Address Register.....                            | 21-18 |
| 5.3 Block Size Register.....                                     | 21-19 |
| 5.4 Block Count Register .....                                   | 21-21 |
| 5.5 Argument Register.....                                       | 21-22 |
| 5.6 Transfer Mode Register .....                                 | 21-23 |
| 5.7 Command Register .....                                       | 21-25 |
| 5.8 Response Register .....                                      | 21-27 |
| 5.9 Buffer Data Port Register.....                               | 21-29 |
| 5.10 Present State Register.....                                 | 21-30 |
| 5.11 Host Control Register .....                                 | 21-36 |
| 5.12 Power Control Register.....                                 | 21-37 |

## Table of Contents (Continued)

### Chapter 21 SD/MMC Host Controller (Continued)

|      |  |       |
|------|--|-------|
| 5.13 | Block Gap Control Register .....                       | 21-38 |
| 5.14 | Wakeup Control Register .....                          | 21-40 |
| 5.15 | Clock Control Register .....                           | 21-41 |
| 5.16 | Timeout Control Register .....                         | 21-43 |
| 5.17 | Software Reset Register .....                          | 21-44 |
| 5.18 | Normal Interrupt Status Register .....                 | 21-46 |
| 5.19 | Error Interrupt Status Register .....                  | 21-50 |
| 5.20 | Normal Interrupt Status Enable Register .....          | 21-53 |
| 5.21 | Error Interrupt Status Enable Register .....           | 21-55 |
| 5.22 | Normal Interrupt Signal Enable Register .....          | 21-56 |
| 5.23 | Error Interrupt Signal Enable Register .....           | 21-58 |
| 5.24 | Autocmd12 Error Status Register .....                  | 21-59 |
| 5.25 | Capabilities Register .....                            | 21-61 |
| 5.26 | Maximum Current Capabilities Register .....            | 21-63 |
| 5.27 | Control Register 2 .....                               | 21-64 |
| 5.28 | Control Register 3 .....                               | 21-67 |
| 5.29 | Debug Register .....                                   | 21-68 |
| 5.30 | Control Register 4 .....                               | 21-68 |
| 5.31 | Force Event Register for Auto CMD12 Error Status ..... | 21-69 |
| 5.32 | Force Event Register for Error Interrupt Status .....  | 21-70 |
| 5.33 | ADMA Error Status Register .....                       | 21-71 |
| 5.34 | ADMA System Address Register .....                     | 21-73 |
| 5.35 | HOST Controller Version Register .....                 | 21-74 |

### Chapter 22 LCD Controller

|     |  |       |
|-----|--|-------|
| 1   | Overview .....                               | 22-1  |
| 1.1 | Features .....                               | 22-2  |
| 2   | Functional Description .....                 | 22-3  |
| 2.1 | Brief of the sub-block .....                 | 22-3  |
| 2.2 | Data Flow .....                              | 22-3  |
| 2.3 | Interface .....                              | 22-4  |
| 2.4 | Overview of the Color Data .....             | 22-5  |
| 2.5 | VD signal Connection .....                   | 22-18 |
| 2.6 | Palette usage .....                          | 22-20 |
| 3   | Window Blending .....                        | 22-22 |
| 3.1 | Overview .....                               | 22-22 |
| 3.2 | Blending Diagram/Details .....               | 22-23 |
| 4   | Vtime Controller Operation .....             | 22-26 |
| 4.1 | RGB Interface .....                          | 22-26 |
| 4.2 | I80-System Interface .....                   | 22-26 |
| 5   | Virtual Display .....                        | 22-27 |
| 6   | RGB Interface I/O .....                      | 22-28 |
| 7   | LCD CPU Interface I/O (I80-system I/F) ..... | 22-29 |
| 8   | Programmer's Model .....                     | 22-31 |
| 8.1 | Overview .....                               | 22-31 |

## Table of Contents (Continued)

### Chapter 23 Camera Interface

|   |       |
|---|-------|
| 1 Overview.....   | 23-1  |
| 1.1 Features.....   | 23-2  |
| 2 External Interface .....  | 23-2  |
| 2.1 Signal Description.....   | 23-2  |
| 2.2 Timing Diagram.....   | 23-3  |
| 3 External/Internal Connection Guide .....                            | 23-5  |
| 4 Camera Interface Operation.....                                     | 23-5  |
| 4.1 Two DMA Ports.....  | 23-5  |
| 4.2 CLOCK Domain .....  | 23-7  |
| 4.3 Frame Memory Hierarchy.....                                       | 23-7  |
| 4.4 Memory Storing Method .....                                       | 23-9  |
| 4.5 Timing Diagram for Register Setting.....                          | 23-10 |
| 4.6 MSDMA Feature .....   | 23-13 |
| 5 Software Interface .....  | 23-14 |
| 6 Camera Interface Special Registers .....                            | 23-14 |
| 6.1 Source Format Register.....                                       | 23-14 |
| 6.2 Window Option Register .....                                      | 23-15 |
| 6.3 Global Control Register .....                                     | 23-17 |
| 6.4 Window Option Register 2 .....                                    | 23-19 |
| 6.5 Y1 Start Address Register .....                                   | 23-19 |
| 6.6 Y2 Start Address Register .....                                   | 23-19 |
| 6.7 Y3 Start Address Register .....                                   | 23-20 |
| 6.8 Y4 Start Address Register .....                                   | 23-20 |
| 6.9 Cb1 Start Address Register .....                                  | 23-20 |
| 6.10 Cb2 Start Address Register .....                                 | 23-21 |
| 6.11 Cb3 Start Address Register .....                                 | 23-21 |
| 6.12 Cb4 Start Address Register .....                                 | 23-21 |
| 6.13 Cr1 Start Address Register.....                                  | 23-21 |
| 6.14 Cr2 Start Address Register.....                                  | 23-22 |
| 6.15 Cr3 Start Address Register.....                                  | 23-22 |
| 6.16 Cr4 Start Address Register.....                                  | 23-22 |
| 6.17 Codec Target Format Register .....                               | 23-23 |
| 6.18 Codec DMA Control Register .....                                 | 23-25 |
| 6.19 Register Setting Guide for Codec Scaler and Preview Scaler ..... | 23-26 |
| 6.20 Codec Pre-Scaler Control Register 1 .....                        | 23-29 |
| 6.21 Codec Pre-Scaler Control Register 2 .....                        | 23-29 |
| 6.22 Codec Main-Scaler Control Register .....                         | 23-30 |
| 6.23 Codec DMA Target Area Register.....                              | 23-30 |
| 6.24 Codec Status Register.....                                       | 23-31 |
| 6.25 RGB1 Start Address Register.....                                 | 23-31 |
| 6.26 RGB2 Start Address Register.....                                 | 23-32 |
| 6.27 RGB3 Start Address Register.....                                 | 23-32 |
| 6.28 RGB4 Start Address Register.....                                 | 23-32 |
| 6.29 Preview Target Format Register.....                              | 23-33 |
| 6.30 Preview DMA Control Register.....                                | 23-34 |

## Table of Contents (Continued)

### Chapter 23 Camera Interface (Continued)

|      |   |       |
|------|---|-------|
| 6.31 | Preview Pre-Scaler Control Register 1 ..... | 23-35 |
| 6.32 | Preview Pre-Scaler Control Register 2 ..... | 23-35 |
| 6.33 | Preview Main-Scaler Control Register .....  | 23-36 |
| 6.34 | Preview DMA Target Area Register .....      | 23-36 |
| 6.35 | Preview Status Register .....               | 23-37 |
| 6.36 | Image Capture Enable Register .....         | 23-38 |
| 6.37 | Codec Capture Sequence Register .....       | 23-39 |
| 6.38 | Codec Scan Line Offset Register .....       | 23-40 |
| 6.39 | Preview Scan Line Offset Register .....     | 23-40 |
| 6.40 | Image Effects Register .....                | 23-42 |
| 6.41 | MSDMA Y start Address Register .....        | 23-43 |
| 6.42 | MSDMA Cb start Address Register .....       | 23-43 |
| 6.43 | MSDMA Cr start Address Register .....       | 23-43 |
| 6.44 | MSDMA Y end Address Register .....          | 23-44 |
| 6.45 | MSDMA Cb end Address Register .....         | 23-44 |
| 6.46 | MSDMA Cr end Address Register .....         | 23-44 |
| 6.47 | MSDMA Y Offset Register .....               | 23-45 |
| 6.48 | MSDMA Cb Offset Register .....              | 23-45 |
| 6.49 | MSDMA Cr Offset Register .....              | 23-45 |
| 6.50 | MSDMA Source Image Width Register .....     | 23-45 |
| 6.51 | MSDMA Control Register .....                | 23-47 |

### Chapter 24 ADC & Touch Screen Interface

|     |  |       |
|-----|--|-------|
| 1   | Overview .....   | 24-1  |
| 1.1 | Features.....  | 24-1  |
| 2   | ADC & Touch Screen Interface Operation.....                | 24-2  |
| 2.1 | Block Diagram .....  | 24-2  |
| 2.2 | Function Descriptions .....                                | 24-3  |
| 3   | ADC and Touch Screen Interface Special Registers.....      | 24-5  |
| 3.1 | ADC Control (ADCCON) Register.....                         | 24-5  |
| 3.2 | ADC Touch Screen Control (ADCTSC) Register .....           | 24-6  |
| 3.3 | ADC Start Delay (ADCDLY) Register.....                     | 24-7  |
| 3.4 | ADC Conversion Data (ADCDAT0) Register .....               | 24-8  |
| 3.5 | ADC Conversion Data (ADCDAT1) Register .....               | 24-9  |
| 3.6 | ADC Touch Screen up-Down Int Check Register (ADCUPDN)..... | 24-9  |
| 3.7 | ADC Channel Mux Register (ADCMUX) .....                    | 24-10 |

## Table of Contents (Continued)

### Chapter 25 IIS-Bus Interface

|  |       |
|--|-------|
| 1 Overview.....                                  | 25-1  |
| 2 Feature.....                                   | 25-1  |
| 3 Signals.....                                   | 25-1  |
| 4 Block Diagram.....                             | 25-2  |
| 5 Functional Descriptions.....                   | 25-2  |
| 5.1 Master/Slave Mode.....                       | 25-3  |
| 6 Audio Serial Data Format.....                  | 25-5  |
| 6.1 IIS-bus Format.....                          | 25-5  |
| 6.2 MSB (Left) Justified.....                    | 25-5  |
| 6.3 LSB (Right) Justified.....                   | 25-5  |
| 6.4 Sampling Frequency and Master Clock.....     | 25-7  |
| 6.5 IIS Clock Mapping Table.....                 | 25-7  |
| 7 Programming guide.....                         | 25-8  |
| 7.1 Initialization.....                          | 25-8  |
| 7.2 Play Mode (TX mode) with DMA.....            | 25-8  |
| 7.3 Recording Mode (RX mode) with DMA.....       | 25-8  |
| 7.4 Example Code.....                            | 25-9  |
| 8 IIS-BUS Interface Special Registers.....       | 25-15 |
| 8.1 IIS Control Register (IISCON).....           | 25-16 |
| 8.2 IIS Mode Register (IISMOD).....              | 25-18 |
| 8.3 IIS FIFO Control Register (IISFIC).....      | 25-20 |
| 8.4 IIS Prescaler Control Register (IISPSR)..... | 25-20 |
| 8.5 IIS Transmit Register (IISTXD).....          | 25-21 |
| 8.6 IIS Receive Register (IISRXD).....           | 25-21 |

### Chapter 26 IIS Multi Audio Interface

|  |      |
|--|------|
| 1 Overview.....                              | 26-1 |
| 2 Feature.....                               | 26-1 |
| 3 Signals.....                               | 26-1 |
| 4 Block Diagram.....                         | 26-2 |
| 5 Functional Descriptions.....               | 26-2 |
| 5.1 Master/Slave Mode.....                   | 26-3 |
| 5.2 DMA Transfer.....                        | 26-4 |
| 6 Audio Serial Data Format.....              | 26-5 |
| 6.1 IIS-Bus Format.....                      | 26-5 |
| 6.2 MSB (Left) Justified.....                | 26-5 |
| 6.3 LSB (Right) Justified.....               | 26-5 |
| 6.4 Sampling Frequency and Master Clock..... | 26-7 |
| 6.5 IIS Clock Mapping Table.....             | 26-7 |

## Table of Contents (Continued)

### Chapter 26 IIS Multi Audio Interface (Continued)

|  |       |
|--|-------|
| 7 Programming Guide.....                         | 26-8  |
| 7.1 Initialization.....                          | 26-8  |
| 7.2 Play Mode (TX mode) with DMA.....            | 26-8  |
| 7.3 Recording Mode (RX mode) with DMA.....       | 26-8  |
| 7.4 Example Code.....                            | 26-9  |
| 8 IIS-BUS Interface Special Registers.....       | 26-15 |
| 8.1 IIS Control Register (IISCON).....           | 26-16 |
| 8.2 IIS Mode Register (IISMOD).....              | 26-18 |
| 8.3 IIS FIFO Control Register (IISFIC).....      | 26-20 |
| 8.4 IIS Prescaler Control Register (IISPSR)..... | 26-20 |
| 8.5 IIS Transmit Register (IISTXD).....          | 26-21 |
| 8.6 IIS Receive Register (IISRXD).....           | 26-21 |

### Chapter 27 AC97 Controller

|   |       |
|---|-------|
| 1 Overview.....   | 27-1  |
| 1.1 Feature.....  | 27-1  |
| 1.2 Signals.....  | 27-1  |
| 2 AC97 Controller Operation.....                                    | 27-2  |
| 2.1 Block Diagram.....  | 27-2  |
| 2.2 Internal Data Path.....   | 27-3  |
| 3 Operation Flow Chart.....   | 27-4  |
| 4 AC-link Digital Interface Protocol.....                           | 27-5  |
| 4.1 AC-link Output Frame (SDATA_OUT).....                           | 27-6  |
| 4.2 AC-link Input Frame (SDATA_IN).....                             | 27-7  |
| 5 AC97 Power-Down.....  | 27-9  |
| 6 Codec Reset.....  | 27-10 |
| 7 AC97 Controller State Diagram.....                                | 27-11 |
| 8 AC97 Controller Special Registers.....                            | 27-12 |
| 8.1 AC97 Special Function Register Summary.....                     | 27-12 |
| 8.2 AC97 Global Control Register (AC_GLBCTRL).....                  | 27-13 |
| 8.3 AC97 Global Status Register (AC_GLBSTAT).....                   | 27-14 |
| 8.4 AC97 Codec Command Register (AC_CODEC_CMD).....                 | 27-14 |
| 8.5 AC97 Codec Status Register (AC_CODEC_STAT).....                 | 27-15 |
| 8.6 AC97 PCM Out/In Channel Fifo Address Register (AC_PCMADDR)..... | 27-15 |
| 8.7 AC97 MIC In Channel FIFO Address Register (AC_MICADDR).....     | 27-16 |
| 8.8 AC97 PCM Out/In Channel FIFO Data Register (AC_PCMDATA).....    | 27-16 |
| 8.9 AC97 MIC In Channel FIFO Data Register (AC_MICDATA).....        | 27-16 |

## Table of Contents (Continued)

### Chapter 28 PCM Audio Interface

|   |       |
|---|-------|
| 1 Overview.....                         | 28-1  |
| 1.1 Feature.....                        | 28-1  |
| 1.2 Signals.....                        | 28-1  |
| 2 PCM Audio Interface.....              | 28-2  |
| 3 PCM Timing.....                       | 28-3  |
| 3.1 PCM Input Clock Diagram.....        | 28-4  |
| 3.2 PCM Registers.....                  | 28-5  |
| 3.3 PCM Register Summary.....           | 28-5  |
| 3.4 PCM Control Register.....           | 28-6  |
| 3.5 PCM CLK Control Register.....       | 28-8  |
| 3.6 The PCM Tx FIFO Register.....       | 28-9  |
| 3.7 PCM Rx FIFO Register.....           | 28-10 |
| 3.8 PCM Interrupt Control Register..... | 28-11 |
| 3.9 PCM Interrupt Status Register.....  | 28-14 |
| 3.10 PCM FIFO Status Register.....      | 28-16 |
| 3.11 PCM Interrupt Clear Register.....  | 28-17 |

### Chapter 29 Electrical Data

|   |      |
|---|------|
| 1 Absolute Maximum Ratings.....         | 29-1 |
| 2 Recommended Operating Conditions..... | 29-2 |
| 3 D.C. Electrical Characteristics.....  | 29-4 |
| 4 A.C. Electrical Characteristics.....  | 29-6 |

### Chapter 30 Mechanical Data

|                           |      |
|---------------------------|------|
| 1 Package Dimensions..... | 30-1 |
|---------------------------|------|

# List of Figures

| Figure Number | Title   | Page Number |
|---------------|---|-------------|
| 1-1           | S3C2451 Block Diagram .....   | 1-5         |
| 1-2           | S3C2451 Pin Assignments (400-FBGA) Top view .....                         | 1-6         |
| 1-3           | Memory Map .....  | 1-32        |
| 2-1           | System Controller Block Diagram .....                                     | 2-2         |
| 2-2           | Power-On Reset Sequence .....   | 2-4         |
| 2-3           | Clock Generator Block Diagram .....                                       | 2-6         |
| 2-4           | Main Oscillator Circuit Examples .....                                    | 2-7         |
| 2-5           | PLL(Phase-Locked Loop) Block Diagram .....                                | 2-8         |
| 2-6           | The Case that Changes Slow Clock by Setting PMS Value .....               | 2-8         |
| 2-7           | The Clock Distribution Block Diagram .....                                | 2-9         |
| 2-8           | MPLL Based Clock Domain .....   | 2-9         |
| 2-9           | EPLL Based Clock Domain .....   | 2-12        |
| 2-10          | Power Mode State Diagram .....  | 2-13        |
| 2-11          | Entering STOP Mode and Exiting STOP Mode (wake-up) .....                  | 2-17        |
| 2-12          | Entering SLEEP Mode and Exiting SLEEP Mode (wake-up) .....                | 2-18        |
| 2-13          | Usage of PWROFF_SLP .....   | 2-34        |
| 3-1           | The Configuration of MATRIX and Memory Sub-System of S3C2451 .....        | 3-1         |
| 5-1           | SMC Block Diagram .....   | 5-3         |
| 5-2           | SMC Core Block Diagram .....  | 5-3         |
| 5-3           | External Memory Two Output Enable Delay State Read .....                  | 5-4         |
| 5-4           | Read Timing Diagram (DRnCS = 1, DRnOWE = 0) .....                         | 5-4         |
| 5-5           | Read Timing Diagram (DRnCS = 1, DRnOWE = 1) .....                         | 5-5         |
| 5-6           | External Synchronous Fixed Length Four Transfer Burst Read .....          | 5-6         |
| 5-7           | External Memory Two Write Enable Delay State Write .....                  | 5-7         |
| 5-8           | Write Timing Diagram (DRnCS = 1, DRnOWE = 0) .....                        | 5-8         |
| 5-9           | Write Timing Diagram (DRnCS = 1, DRnOWE = 1) .....                        | 5-8         |
| 5-10          | Synchronous Two Wait State Write .....                                    | 5-9         |
| 5-11          | Read, then two Writes (WSTRD=WSTWR=0), Two Turnaround Cycles (IDCY=2) ... | 5-10        |
| 5-12          | Memory Interface with 8-bit SRAM (2MB) .....                              | 5-12        |
| 5-13          | Memory Interface with 16-bit SRAM (4MB) .....                             | 5-12        |
| 6-1           | Mobile DRAM Controller Block Diagram .....                                | 6-2         |
| 6-2           | Memory Interface with 16-bit SDRAM (4Mx16, 4banks) .....                  | 6-4         |
| 6-3           | Memory Interface with 32-bit SDRAM (4Mx16 * 2ea, 4banks) .....            | 6-4         |
| 6-4           | Memory Interface with 16-bit Mobile DDR and DDR2 .....                    | 6-5         |
| 6-5           | DRAM Timing Diagram .....   | 6-6         |
| 6-6           | CL (CAS Latency) Timing Diagram .....                                     | 6-6         |
| 6-7           | t <sub>ARFC</sub> Timing Diagram .....                                    | 6-7         |

# List of Figures

|---------------|---|-------------|
| 7-1           | NAND Flash Controller Block Diagram.....                          | 7-2         |
| 7-2           | NAND Flash Controller Boot Loader Block Diagram.....              | 7-2         |
| 7-3           | CLE & ALE Timing (TACLS=1, TWRPH0=0, TWRPH1=0) Block Diagram..... | 7-3         |
| 7-4           | nWE & nRE Timing (TWRPH0=0, TWRPH1=0) Block Diagram.....          | 7-4         |
| 7-5           | NAND Flash Memory Mapping Block Diagram.....                      | 7-10        |
| 7-6           | A 8-bit NAND Flash Memory Interface Block Diagram.....            | 7-11        |
| 7-7           | Softlock and Lock-tight.....                                      | 7-20        |
| 8-1           | CF Controller Top Block Diagram.....                              | 8-3         |
| 8-2           | PC Card Controller Top Block Diagram.....                         | 8-4         |
| 8-3           | ATA Controller Top Block Diagram.....                             | 8-5         |
| 8-4           | PC Card State Definition.....                                     | 8-6         |
| 8-5           | PIO Mode Waveform.....  | 8-7         |
| 8-6           | Memory Map Diagram.....   | 8-8         |
| 9-1           | Basic DMA Timing Diagram.....                                     | 9-4         |
| 9-2           | Demand/Handshake Mode Comparison.....                             | 9-5         |
| 9-3           | Burst 4 Transfer size.....  | 9-6         |
| 9-4           | Single service, Demand Mode, Single Transfer Size.....            | 9-7         |
| 9-5           | Single service, Handshake Mode, Single Transfer Size.....         | 9-7         |
| 9-6           | Whole service, Handshake Mode, Single Transfer Size.....          | 9-7         |
| 10-1          | Interrupt Process Diagram.....                                    | 10-1        |
| 10-2          | Interrupt Group Multiplexing Diagram.....                         | 10-2        |
| 10-3          | Priority Generating Block.....                                    | 10-6        |
| 12-1          | Watchdog Timer Block Diagram.....                                 | 12-2        |
| 13-1          | 16-bit PWM Timer Block Diagram.....                               | 13-2        |
| 13-2          | Timer Operations.....   | 13-4        |
| 13-3          | Example of Double Buffering Function.....                         | 13-5        |
| 13-4          | Example of a Timer Operation.....                                 | 13-7        |
| 13-5          | Example of PWM.....   | 13-8        |
| 13-6          | Inverter On/Off.....  | 13-9        |
| 13-7          | The Wave Form When a Dead Zone Feature is Enabled.....            | 13-10       |
| 13-8          | Timer4 DMA Mode Operation.....                                    | 13-11       |

## PRODUCT OVERVIEW

### 1 INTRODUCTION

This user's manual describes SAMSUNG's S3C2451 16/32-bit RISC microprocessor. SAMSUNG's S3C2451 is designed to provide hand-held devices and general applications with low-power, and high-performance micro-controller solution in small die size. To reduce total system cost, the S3C2451 includes the following components.

The S3C2451 is developed with ARM926EJ core, 65nm CMOS standard cells and a memory complier. Its low-power, simple, elegant and fully static design is particularly suitable for cost- and power-sensitive applications. It adopts a new bus architecture known as Advanced Micro controller Bus Architecture (AMBA).

The S3C2451 offers outstanding features with its CPU core, a 16/32-bit ARM926EJ RISC processor designed by Advanced RISC Machines, Ltd. The ARM926EJ implements MMU, AMBA BUS, and Harvard cache architecture with separate 16KB instruction and 16KB data caches, each with an 8-word line length.

By providing a complete set of common system peripherals, the S3C2451 minimizes overall system costs and eliminates the need to configure additional components. The integrated on-chip functions that are described in this document include:

- Around 400MHz @ 1.3V, 533MHz @ 1.325V Core, 1.8V/2.5V/3.0V/3.3V ROM/SRAM, 1.8V/2.5V mSDR/mDDR/DDR2 SDRAM, 1.8V/2.5V/3.3V external I/O microprocessor with 16KB I/D-Cache/MMU
- External memory controller (mSDR/mDDR/DDR2 SDRAM Control and Chip Select logic) and CF/ATA I/F controller
- LCD controller (up to 256K color) with LCD-dedicated DMA
- 8-ch DMA controllers with external request pins
- 4-ch UARTs (IrDA1.0, 64-Byte Tx FIFO, and 64-Byte Rx FIFO)
- 2-ch High Speed SPIs
- 2 IIC bus interfaces (multi-master support)
- 2 IIS Audio CODEC interfaces (24-bit, port 0 supports 5.1ch, port 1 supports 2ch)
- AC97 CODEC Interface
- 2 High-Speed MMC and SDMMC combo (SD Host 2.0 and MMC protocol 4.2 compatible)
- 2-ch USB Host controller (ver 1.1 Compliant)/1-ch USB Device controller (ver 2.0 Compliant)
- 4-ch PWM timers / 1-ch Internal timer / Watch Dog Timer
- 10-ch 12-bit ADC and Touch screen interface
- RTC with calendar function
- Camera interface (Max. 8M pixels input support. 2M pixel input support for scaling)
- 174 General Purpose I/O ports / 24-ch external interrupt source
- Power control: Normal, Idle, Stop, Deep Stop and Sleep mode
- On-chip clock generator with PLL

## 2 FEATURES

### 2.1.1 Architecture

- Integrated system for hand-held devices and general embedded applications.
- 16/32-Bit RISC architecture and powerful instruction set with ARM926EJ CPU core.
- Enhanced ARM architecture MMU to support WinCE, EPOC 32 and Linux.
- Instruction cache, data cache, write buffer and Physical address TAG RAM to reduce the effect of main memory bandwidth and latency on performance.
- ARM926EJ CPU core supports the ARM debug architecture.
- Internal Advanced Microcontroller Bus Architecture (AMBA) (AMBA2.0, AHB/APB).

### 2.1.2 System Manager

- Little/Big Endian support.
- Two independent memory bus - one for the ROM/SRAM bus (ROM Bank0~Bank5) and one for the DRAM bus (mSDR/mDDR/DDR2 SDRAM Bank0~Bank1)
- Address space: 64M bytes for Rom bank0 ~ bank5, 128M bytes for SDRAM bank0 ~ bank1.
- Supports programmable 8/16-bit data bus width for ROM/SRAM bank and programmable 16/32-bit data bus width for SDRAM bank
- Fixed bank start address from Rom bank 0 to bank 5 and SDRAM bank 0 to bank1.
- Eight memory banks:
  - Six memory banks for ROM, SRAM, and others (NAND/CF etc.).
  - Two memory banks for Synchronous DRAM.
- Complete Programmable access cycles for all memory banks.
- Supports external wait signals to expand the bus cycle.
- Supports self-refresh mode in SDRAM for power-down.
- Supports various types of ROM for booting (NOR Flash, EEPROM, OneNAND, IROM and others).

### 2.1.3 NAND Flash

- Supports booting from NAND flash memory by selecting OM as IROM boot mode. (Only 8bit Nand and 8ECC is supported when it boots)
- 64KB for internal SRAM Buffer(8KB internal buffer for booting)
- Supports storage memory for NAND flash memory after booting.
- Supports Advanced NAND flash

### 2.1.4 Cache Memory

- 4-way set-associative cache with I-Cache (16KB) and D-Cache (16KB).
- 8words length per line with one valid bit and two dirty bits per line.
- Pseudo random or round robin replacement algorithm.
- Write-through or write-back cache operation to update the main memory.
- The write buffer can hold 16 words of data and four addresses.

### 2.1.5 Clock & Power Manager

- On-chip MPLL and EPLL:
  - EPLL generates the clock to operate USB Host, IIS, UART, etc.
  - MPLL generates the clock to operate MCU at maximum 533MHz @ 1.325 V.
- Clock can be fed selectively to each function block by software.
- Power mode: Normal, Idle, Stop, Deep Stop and Sleep mode
  - Normal mode: Normal operating mode
  - Idle mode: The clock for only CPU is stopped.
  - Stop mode: All clocks are stopped.
  - Deep Stop mode: CPU power is gated and all clocks are stopped.
  - Sleep mode: The Core power including all peripherals is shut down.
- Woken up by EINT[15:0] or RTC alarm & tick interrupt from Sleep mode and (Deep)STOP mode.

## 2 FEATURES (Continued)

### 2.1.6 Interrupt Controller

- 77 Interrupt sources (One Watch dog timer, 5 timers, 12 UARTs, 24 external interrupts, 8 DMA, 2 RTC, 2 ADC, 2 IIC, 2 SPI, 2 SDI, 2 USB, 4 LCD, 1 Battery Fault, 1 NAND, 1 CF, 1 AC97 and 2 CAM I/F, 2 I2S, 2 PCM, 1 2D)
- Level/Edge mode on external interrupt source
- Programmable polarity of edge and level
- Supports Fast Interrupt request (FIQ) for very urgent interrupt request

### 2.1.7 Timer with Pulse Width Modulation (PWM)

- 4-ch 16-bit Timer with PWM / 1-ch 16-bit internal timer with DMA-based or interrupt-based operation
- Programmable duty cycle, frequency, and polarity
- Dead-zone generation
- Supports external clock sources

### 2.1.8 RTC (Real Time Clock)

- Full clock feature: msec, second, minute, hour, date, day, month, and year
- 32.768 KHz operation
- Alarm interrupt
- Time tick interrupt

### 2.1.9 General Purpose Input/Output Ports

- 24 external interrupt ports
- 174 Multiplexed input/output ports

### 2.1.10 DMA Controller

- 8-ch DMA controller
- Supports memory to memory, IO to memory, memory to IO, and IO to IO transfers
- Burst transfer mode to enhance the transfer rate

### 2.1.11 LCD Controller

- Supports 1, 2, 4 or 8 bpp (bit-per-pixel) palette color displays for color
- Supports 16, 24 bpp non-palette true-color displays for color
- Supports maximum 16M color at 24 bpp mode
- Supports multiple screen size
  - Typical actual screen size: 640x480, 320x240, 160x160, and others.
  - Maximum frame buffer size is 4Mbytes.
  - Maximum virtual screen size in 64K color mode: 2048x2048, and others
- Support 2 overlay windows for LCD

### 2.1.12 Camera Interface

- ITU-R BT 601/656 8-bit mode support
- DZI (Digital Zoom In) capability
- Programmable polarity of video sync signals
- Max. 4096x4096 pixels input support (2048x2048 pixel input support for scaling)
- Image mirror and rotation (X-axis mirror, Y-axis mirror, and 180° rotation)
- Camera output format (RGB 16/24-bit and YCbCr 4:2:0/4:2:2 formats)

### 2.1.13 UART

- 4-channel UART with DMA-based or interrupt-based operation
- Supports 5-bit, 6-bit, 7-bit, or 8-bit serial data transmit/receive (Tx/Rx)
- Supports external clocks for the UART operation (EXTUARTCLK)
- Programmable baud rate upto 3Mbps
- Supports IrDA 1.0
- Loopback mode for testing
- Each channel has internal 64-byte Tx FIFO and 64-byte Rx FIFO.

## 2 FEATURES (Continued)

### 2.1.14 A/D Converter & Touch Screen Interface

- 10-ch multiplexed ADC
- Max. 500KSPS and 12-bit Resolution
- Internal FET for direct Touch screen interface

### 2.1.15 Watchdog Timer

- 16-bit Watchdog Timer
- Interrupt request or system reset at time-out

### 2.1.16 IIC-Bus Interface

- 2-ch Multi-Master IIC-Bus
- Serial, 8-bit oriented and bi-directional data transfers can be made at up to 100 Kbit/s in Standard mode or up to 400 Kbit/s in Fast mode.

### 2.1.17 2D

- Line/Point Drawing
- BitBLT, Color Expansion.
- Maximum 2040\*2040 image size
- Window clipping
- 90°/180°/270°/X-flip/Y-flip Rotation
- Totally 256 3-operand Raster Operation (ROP)
- Alpha Blending
- 16/24/32-bpp color format support

### 2.1.18 IIS Multi Audio Interface / IIS-Bus

- 2 ports audio interface with DMA-based operation.
- Port 0 : up to 5.1ch, three 32bit 16depth Tx FIFOs, One 32bit 16depth Rx FIFO
- Port 1 : 2ch, 32bit 16depth Tx FIFO, 32bit 16depth Rx FIFO
- Serial, 8-/16-/24- bit per channel data transfers
- Supports IIS format and MSB-justified data format

### 2.1.19 AC97 Audio Interface

- 1port AC97 for audio interface with DMA-based operation
- 16-bit Stereo Audio

### 2.1.20 PCM Audio Interface

- Mono, 16bit PCM, 2 ports audio interface.

- Master mode only, this block always sources the main shift clock
- Input (16bit 32depth) and output(16bit 32depth) FIFOs to buffer data

### 2.1.21 USB Host

- 2-port USB Host
- Complies with OHCI Rev. 1.0
- Compatible with USB Specification version 1.1

### 2.1.22 USB Device

- 1-port USB Device
- 9 Endpoints for USB Device
- Compatible with USB Specification version 2.0

### 2.1.23 SD/MMC Host Interface

- SD Standard Host Spec(ver2.0) compatible
- Dedicated DMA access support
- Compatible with SD Memory Card Protocol version 2.1
- Compatible with SDIO Card Protocol version 1.0
- Compatible with HS-MMC Protocol version 4.2
- 512 Bytes FIFO for Tx/Rx
- CE-ATA mode support

### 2.1.24 SPI Interface

- Compatible with 2-ch Serial Peripheral Interface Protocol version 2.11 (2ch. High speed SPI interface)
- 2x8 bits Shift register for Tx/Rx
- DMA-based or interrupt-based operation

### 2.1.25 Operating Voltage Range

- Core: 1.3V for 400MHz  
1.325 for 533MHz
- ROM/SRAM: 1.8V/ 2.5V/3.0V/3.3V
- SDRAM: 1.8V/ 2.5V
- I/O: 1.8V/2.5V/3.3V(refer to electrical data)

### 2.1.26 Operating Frequency

- FCLK Up to 533MHz
- HCLK Up to 133MHz
- PCLK Up to 67MHz

### 2.1.27 Package

- 380 FBGA 14x14

| 380        | VDDA_ADC    | VDDA_ADC         | -                | P                 |             |

**NOTES:**

1. The @BUS REQ. shows the pin state at the external bus, which is used by the other bus master.
2. ' - ' mark indicates the unchanged pin state at Bus Request mode.
3. Hi-z or Pre means Hi-z or early state and it is determined by the setting of MISCCR register.
4. AI/AO means analog input/analog output.
5. P, I, and O mean power, input and output respectively.
6. The I/O state @nRESET shows the pin status in the @nRESET duration below.

Table 1-3. I/O Cell Types and Descriptions

| Cell Name       | Ftn. | Interface Voltage | CMOS /Schmitt | Retention IO | Pull-up /Control | Pull-down /Control | Driver Strength     |
|-----------------|------|-------------------|---------------|--------------|------------------|--------------------|---------------------|

4.1 SIGNAL DESCRIPTIONS

Table 1-4. S3C2451 Signal Descriptions

| Signal                                     | In/Out | Description  |
|--|--------|--|
| <b>Reset, Clock &amp; Power</b>            |        |  |
| XTIpll                                     | AI     | Crystal input signals for internal osc circuit.<br>When OM[0] = 0, XTIpll is used for MPLL CLK source and EPLL CLK source.<br>If it isn't used, it has to be Low (0V)                                  |
| XTOpll                                     | AO     | Crystal output signals for internal osc circuit.<br>When OM[0] = 0, XTIpll is used for MPLL CLK source and EPLL CLK source. If it isn't used, it has to be float                                       |
| NC   | AI     | Not connected.   |
| EPLLCAP                                    | AI     | Loop filter capacitor for Extra PLL  |
| XTIrtc                                     | AI     | 32.768 kHz crystal input for RTC. If it isn't used, it has to be High (VDD_RTC=3.3V).  |
| XTOrtc                                     | AO     | 32.768 kHz crystal output for RTC. If it isn't used, it has to be float.   |
| CLKOUT[1:0]                                | O      | Clock output signal. The CLKSEL of MISCCR(GPIO register) register configures the clock output mode among the MPLL_CLK, EPLL CLK, ARMCLK, HCLK, PCLK.   |
| nRESET                                     | ST     | nRESET suspends any operation in progress and places S3C2451 into a known reset state. For a reset, nRESET must be held to L level for at least 4 OSCin after the processor power has been stabilized. |
| nRSTOUT                                    | O      | For external device reset control (nRSTOUT = nRESET & nWDTRST & SW_RESET) *SW_RESET = nRSTCON of GPIO MISCCR   |
| PWREN                                      | O      | core power on-off control signal   |
| nBATT_FLT                                  | I      | Probe for battery state (Does not wake up at Sleep mode in case of low battery state). If it isn't used, it has to be High (3.3V).   |
| OM[4:0]                                    | I      | OM[4:0] set operating modes of S3C2451<br>Refer to " <b>S3C2451 Operation Mode Description Table</b> "   |
| EXTCLK                                     | I      | External clock source.<br>When OM[0] = 1, EXTCLK is used for MPLL and EPLL CLK source.<br>If it isn't used, it has to be Low (0V).   |
| <b>Memory Interface (ROM/SRAM/NAND/CF)</b> |        |  |
| RADDR[25:0]                                | O      | RADDR[25:0] (Address Bus) outputs the memory address of the corresponding bank .   |
| RDATA[15:0]                                | IO     | RDATA[15:0] (Data Bus) inputs data during memory read and outputs data during memory write. The bus width is programmable among 8/16-bit.  |
| nRCS[5:0]                                  | O      | nRCS[5:0] (Chip Select) are activated when the address of a memory is within the address region of each bank. The number of access cycles and the bank size can be programmed.                         |
| nRWE                                       | O      | nRWE (Write Enable) indicates that the current bus cycle is a write cycle.   |
| nROE                                       | O      | nOE (Output Enable) indicates that the current bus cycle is a read cycle.  |

| Signal                  | In/Out | Description  |
|-------------------------|--------|--|
| nRBE[1:0]               | O      | Upper byte/lower byte enable (In case of 16-bit SRAM)  |
| nWAIT                   | I      | nWAIT requests to prolong a current bus cycle. As long as nWAIT is L, the current bus cycle cannot be completed. If nWAIT signal isn't used in your system, nWAIT signal must be tied on pull-up resistor. |
| <b>SDRAM I/F</b>        |        |  |
| SADDR[15:0]             | O      | SDRAM Address bus  |
| SDATA[31:0]             | IO     | SDRAM Data Bus   |
| nSRAS                   | O      | SDRAM row address strobe   |
| nSCAS                   | O      | SDRAM column address strobe  |
| nSWE                    | O      | SDRAM write enable   |
| nSCS[1:0]               | O      | SDRAM chip select  |
| DQM[3:0]                | O      | SDRAM data mask  |
| DQS[1:0]                | O      | mDDR/DDR2 Data Strobe  |
| SCLK                    | O      | SDRAM clock  |
| nSCLK                   | O      | mDDR/DDR2 Conversion clock   |
| SCKE                    | O      | SDRAM clock enable   |
| <b>NAND Flash</b>       |        |  |
| FCLE                    | O      | Command latch enable   |

| I2S1_SDO                         | O      | IIS-bus serial data output                             |
| <b>AC'97</b>                     |        |  |
| AC_nRESET                        | IO     | AC'97 Master H/W Reset                                 |
| AC_SYNC                          | IO     | 12.288MHz serial data clock                            |
| AC_BIT_CLK0                      | O      | 48kHz fixed rate sample sync                           |
| AC_SDIO                          | I      | Serial, time division multiplexed, AC'97 input stream  |
| AC_SDO0                          | O      | Serial, time division multiplexed, AC'97 output stream |
| <b>PCM</b>                       |        |  |
| PCM0_SCLK<br>PCM1_SCLK           | O      | Serial shift clock                                     |
| PCM0_FSYNC<br>PCM1_FSYNC         | O      | Serial data indicator and synchronizer                 |
| PCM0_SDI<br>PCM1_SDI             | I      | Serial PCM input data                                  |
| PCM0_SDO<br>PCM1_SDO             | O      | Serial PCM output data                                 |
| PCM0_CDCLK<br>PCM1_CDCLK         | I      | Optional External Clock source                         |
| <b>USB Host</b>                  |        |  |

| Signal                 | In/Out | Description  |
|------------------------|--------|--|
| DN                     | IO     | DATA(-) from USB host. (Need to 15kΩ pull-down)  |
| DP                     | IO     | DATA(+) from USB host. (Need to 15kΩ pull-down)  |
| <b>USB Device</b>      |        |  |
| DM_UDEV                | IO     | DATA(-) for USB peripheral.  |
| DP_UDEV                | IO     | DATA(+) for USB peripheral.  |
| REXT                   | O      | External Resistor ( 44.2ohm +/- 1%)  |
| XO_UDEV                | OSC    | Crystal output   |
| XI_UDEV                | OSC    | Crystal input  |
| <b>SPI</b>             |        |  |
| SPIMISO[1:0]           | IO     | SPIMISO is the master data input line, when SPI is configured as a master.<br>When SPI is configured as a slave, these pins reverse its role.  |
| SPIMOSI[1:0]           | IO     | SPIMOSI is the master data output line, when SPI is configured as a master.<br>When SPI is configured as a slave, these pins reverse its role.   |
| SPICLK[1:0]            | IO     | SPI clock  |
| nSS[1:0]               | I      | SPI chip select (only for slave mode)  |
| <b>SDMMC Interface</b> |        |  |
| SD1_DAT[7:0]           | IO     | SD1 receive/transmit data  |
| SD1_CMD                | IO     | SD1 receive response/ transmit command   |
| SD1_CLK                | O      | SD1 clock  |
| SD1_nWP                | O      | SD1 Write Protect  |
| SD1_nCD                | O      | SD1 Card Detect  |
| SD1_nLED               | O      | SD1 LED  |
| SD0_DAT[3:0]           | IO     | SD0 receive/transmit data  |
| SD0_CMD                | IO     | SD0 receive response/ transmit command   |
| SD0_CLK                | O      | SD0 clock  |
| <b>General Port</b>    |        |  |
| GPn[173:0]             | IO     | General input/output ports, which are multiplexed with other function pins (some ports are output only).   |
| <b>TIMMER/PWM</b>      |        |  |
| TOUT[3:0]              | O      | Timer output[3:0]  |
| TCLK                   | I      | External timer clock input   |
| <b>JTAG TEST LOGIC</b> |        |  |
| nTRST                  | I      | nTRST (TAP Controller Reset) resets the TAP controller at start.<br>If debugger is used, A 10K pull-up resistor has to be connected.<br>If debugger (black ICE) is not used, nTRST pin must be issued by a low active pulse (Typically connected to nRESET). |
| TMS                    | I      | TMS (TAP Controller Mode Select) controls the sequence of the TAP controller's states.   |

| Signal       | In/Out | Description  |
|--------------|--------|--|
| TCK          | I      | TCK (TAP Controller Clock) provides the clock input for the JTAG logic.  |
| TDI          | I      | TDI (TAP Controller Data Input) is the serial input for test instructions and data.  |
| TDO          | O      | TDO (TAP Controller Data Output) is the serial output for test instructions and data.                                      |
| RTCK         | O      | Returned Clock   |
| <b>Power</b> |        |  |
| VDDalive     | P      | S3C2451 reset block and port status register VDD.<br>It should be always supplied whether in normal mode or in Sleep mode. |
| VDDiarm      | P      | S3C2451 core logic VDD for ARM core.   |
| VDDi         | P      | S3C2451 core logic VDD for Internal block.   |
| VDDA_MPLL    | P      | S3C2451 MPLL analog and digital VDD.   |
| VDDA_EPLL    | P      | S3C2451 EPLL analog and digital VDD  |
| VDD_SDRAM    | P      | S3C2451 SDRAM I/O Power (1.8V/ 2.5V)   |
| VDD_SRAM     | P      | S3C2451 ROM/SRAM I/O Power   |
| VDD_OP1      | P      | S3C2451 System I/O Power 1 (1.8 ~ 3.3V)  |
| VDD_OP2      | P      | S3C2451 System I/O Power 2 ( 1.8 ~ 3.3V)   |
| VDD_OP3      | P      | S3C2451 System I/O Power 3 ( 1.8 ~ 3.3V)   |
| VDD_CAM      | P      | S3C2451 Camera I/O Power (1.8 ~ 3.3V)  |
| VDD_LCD      | P      | S3C2451 LCD I/O Power (1.8 ~ 3.3V)   |
| VDD_SD       | P      | S3C2451 SD/MMC I/O Power (1.8 ~ 3.3V)  |
| VDD_RTC      | P      | RTC VDD (Input range: 1.8 ~ 3.3V)<br>This pin must be connected to power properly if RTC isn't used.                       |
| VDDA_ADC     | P      | S3C2451 ADC VDD(3.3V)  |
| VSSi/VSSiarm | G      | S3C2451 core logic VSS   |
| VSSA_MPLL    | G      | S3C2451 MPLL analog and digital VSS.   |
| VSSA_EPLL    | G      | S3C2451 EPLL analog and digital VSS  |
| VSS_SDRAM    | G      | S3C2451 SDRAM I/O Ground   |
| VSS_SRAM     | G      | S3C2451 ROM/SRAM I/O Ground  |
| VSS_OP1      | G      | S3C2451 System I/O Ground  |
| VSS_OP2      | G      | S3C2451 System I/O Ground  |
| VSS_OP3      | G      | S3C2451 System I/O Ground  |
| VSS_CAM      | G      | S3C2451 Camera I/O Ground  |
| VSS_LCD      | G      | S3C2451 LCD I/O Ground   |
| VSS_SD       | G      | S3C2451 SD/MMC I/O Ground  |
| VSSA_ADC     | G      | S3C2451 ADC VSS  |
| VDD_USBOSC   | P      | USB 2.0 Oscillator Power(1.8 ~ 3.3V)   |
| VDDI_UDEV    | P      | USB 2.0 PHY Power ( 1.2V)  |
| VSSI_UDEV    | G      | USB 2.0 PHY Ground   |

| Signal           | In/Out | Description               |
|------------------|--------|---------------------------|
| VDDA33C/VDDA33T1 | P      | USB 2.0 PHY Power ( 3.3V) |
| VSSA33C/VSSA33T2 | G      | USB 2.0 PHY Ground        |

**NOTE:** I/O : Input/Output. AI/AO : Analog I/O. ST : Schmitt-trigger. P : Power. G : Ground.

## 4.2 S3C2451 OPERATION MODE DESCRIPTION

Table 1-5. S3C2451 Operation Mode Description

| OM[4] | OM[3] | OM[2] | OM[1] | OM[0] | OM[4]    | OM[3]                        | OM[2]           | OM[1]              | OM[0]    | Operation Mode               |                    |
|-------|-------|-------|-------|-------|----------|------------------------------|-----------------|--------------------|----------|------------------------------|--------------------|

### Cautions on S3C2451 Special Registers

1. S3C2451 does not support the big endian mode.
2. The special registers have to be accessed for each recommended access unit.
3. All registers except ADC registers, RTC registers and UART registers must be read/write in word unit (32-bit).
4. Make sure that the ADC registers, RTC registers and UART registers be read/write by the specified access unit and the specified address.
5. W : 32-bit register, which must be accessed by LDR/STR or int type pointer (int \*).  
HW : 16-bit register, which must be accessed by LDRH/STRH or short int type pointer (short int \*).  
B : 8-bit register, which must be accessed by LDRB/STRB or char type pointer (char int \*).

## SYSTEM CONTROLLER

### 1 OVERVIEW

The system controller consists of three parts; reset control, system clock control, and system power-management control. The system clock control logic in S3C2451 can generate the required system clock signals which are the inputs of ARM926EJ, several AHB blocks, and APB blocks. There are two PLLs in S3C2451 to generate internal clocks. One is for general functional blocks, which include ARM, AHB, and APB. The other is for the special functional clocks which are the USB, I2S and camera interface clock. Software program control the operating frequency of the PLLs, internal clock sources and enabled or disabled the clocks to reduce the power consumption.

S3C2451 has various power-down modes to keep optimal power consumption for a given task. The power-down modes consists of four modes; NORMAL mode, IDLE mode, STOP mode, and SLEEP mode. In NORMAL mode, the input clock of each block is enabled or disabled according to the software to eliminate the power consumption of unused blocks for a certain application. For example, if an UART is not needed, the software can disable the input clock independently. The major power dissipation of S3C2451 is due to ARM core, since the operating speed is relative higher than that of the other blocks. Typically, the operating frequency of the ARM core is 533MHz, while the AHB blocks and the APB blocks operate on 133MHz and 66MHz, respectively. Thus, the power control of the ARM core is major issue to reduce the overall power dissipation in S3C2451, and IDLE mode is supported for this purpose. In IDLE mode, the ARM core is not operated until the external interrupts or internal interrupts. The STOP mode freezes all clocks to all peripherals as well as the ARM core by disabling PLLs. The power consumption is only due to the leakage current and the minimized alive block in S3C2451. SLEEP mode is intended to disconnect the internal power. So, the power consumption due to the ARM core and the internal logic except the wake-up logic will be nearly zero in the SLEEP mode. In order to use the SLEEP mode two independent power sources are required. One of the two power sources supplies the power for the wake-up logic. The other one supplies the normal functional blocks including the ARM core. It should be controlled in order to turn ON/OFF with a special pin in S3C2451. The detailed description of the power-saving modes such as the entering sequence to the specific power-down mode or the wake-up sequence from a power-down mode is given in the following Power Management section.

### 2 FEATURE

- Include two on-chip PLLs called main PLL(MPLL), extra PLL(EPLL)
- MPLL generates the system reference clock
- EPLL generates the clocks for the special functional blocks
- Independent clock ON/OFF control to reduce power consumption
- Support three power-down modes, IDLE, STOP, and SLEEP, to optimize the power dissipation
- Wake-up by one of external Interrupt, RTC alarm, Tick interrupt and BATT\_FLT.(Stop and Sleep mode)
- Control internal bus arbitration priority

### 3 BLOCK DIAGRAM

**Figure 2-1. System Controller Block Diagram**

Figure 2-1 shows the system controller block diagram. The system controller is divided into two blocks, which are the OFF block and the ON block. Since the system controller must be alive when the external power supply is disabled. The ALIVE-part is supplied by an auxiliary power source and waits until external/internal interrupts. However, the OFF-part is disabled when the power-down mode is SLEEP. The clock generator makes all internal clocks, which include ARMCLK for the ARM core, HCLK for the AHB blocks, PCLK for the APB block, and other special clocks. The special functional registers (SFR) are located at the register blocks, and their values are configured through AHB interface. If a software want to change into a power-down mode, then the power management blocks detect the values within the SFR and change the mode. In addition, they assert the external power ON/OFF signal if required. All reset signals are generated at the reset control block.

The detailed explanations for each block will be described in the following sections.

## 4 FUNCTIONAL DESCRIPTIONS

The system controller for S3C2451 has three functions, which include the reset management, the clock generation, and the power management. In this section, the behavior will be described.

### 4.1 RESET MANAGEMENT AND TYPES

S3C2451 has four types of resets and reset controller in system controller can place the system into the predefined states with one of the following four resets.

- **Hardware Reset** – It is generated when nRESET pin is asserted. It is an uncompromised, unmaskable, and complete reset, which is used when you need no information in system any more.
- **Watchdog Reset** – The watchdog timer monitors the device state and generates the watchdog reset when the state is abnormal.
- **Software Reset** – Software can initialize the internal state by writing the special control register (SWRST).
- **Wakeup Reset** – When the system wakes up from SLEEP mode, it generates reset signals. And When the system wakes up from Deep-STOP mode, it generates ARM reset only.

### 4.2 HARDWARE RESET

When S3C2451 is power-ON, the external device must assert nRESET to initialize internal states.

Hardware reset is invoked when the nRESET pin is asserted and all units in the system (except RTC) are initialized to known states. During the hardware reset, the following actions will occur:

- All internal registers and ARM926EJ core goes into their pre-defined initial state.
- All pins get their reset state, and BATT\_FLT pin is ignored.
- The nRSTOUT pin is asserted while the reset is progressed.

When the unmaskable nRESET pin is asserted as low, the internal hardware reset signal is generated. Upon assertion of nRESET, S3C2451 enters reset state regardless of the previous state. To enter hardware reset state, nRESET must be held long enough to allow internal stabilization and propagation of the reset state.

*Caution:* An external power source, regulator, for S3C2451 must be stable prior to the deassertion of nRESET. Otherwise, it damages to S3C2451 and its operation will not be guaranteed.

Figure 2-2 shows the clock behavior during the power-on reset sequence. The crystal oscillator begins oscillation within several milliseconds after the power source supplies enough power-level to S3C2451. Initially, two internal PLLs (MPLL and EPLL) stop. The nRESET pin should be released after the fully settle-down of the power supply-level. S3C2451 requires a hazard-free system clock (SYSCLK, ARMCLK, HCLK, and PCLK) to operate properly when the system reset is released. Since the PLL does not work initially, the PLL input clock ( $F_{IN}$ ) is directly fed to SYSCLK instead of the PLL output clock ( $F_{OUT}$ ). Software must configure MPLLCON and EPLLCON register to use each PLL. The PLL begins the lockup sequence toward the new frequency only after the S/W configures the PLL with a new frequency-value. The PLL output is immediately fed to SYSCLK after lock time.

You should be aware that the crystal oscillator settle-down time is not explicitly added by the hardware during the power-up sequence and the crystal oscillation must be settle-down during this period. However, S3C2451 will explicitly add the crystal oscillator settle-down time (OSCWAIT) when it wakes up from the STOP mode.

The EPLL output clock is directly fed to some special clocks for TFT Controller, I2S, HS-MMC, USB host and UART. Since the EPLL input clock is initially fed to the input clocks for them, software must configure EPLLCON register to use the EPLL.

Figure 2-2. Power-On Reset Sequence

### 4.3 WATCHDOG RESET

Watchdog reset is invoked when software fails to prevent the watchdog timer from timing out.

During the watchdog reset, the following actions occur :

- All units(except some blocks listed in table 2-1 ) go into their pre-defined reset state.
- All pins get their reset state, and BATT\_FLT pin is ignored.
- The nRSTOUT pin is asserted during watchdog reset.

Watchdog reset can be activated in normal and idle mode because watchdog timer can expire with clock.

Watchdog reset is invoked when watchdog timer and reset are enabled ( $WTCON[5] = 1$ ,  $WTCON[0]=1$ ) and watchdog timer is expired. Watchdog reset is invoked then, the following sequence occurs. :

1. Watchdog reset source asserts.
2. Internal reset signals and nRSTOUT are asserted and reset counter is activated.
3. Reset counter is expired then, internal reset signals and nRSTOUT are deasserted.

#### 4.4 SOFTWARE RESET

Software can initialize the device state itself when it writes "0x533C\_2451" to SWRST register.

During the software reset, the following actions occur :

- All units(except some blocks listed in table 2-1 ) go into their pre-defined reset state.
- All pins get their reset state, and BATT\_FLT pin is ignored.
- The nRSTOUT pin is asserted during software reset.

Software reset is invoked then, the following sequence occurs. :

1. User write "0x533C\_2451" to SWRST register.
2. System controller request bus controller to finish current transactions.
3. Bus controller send acknowledge to system controller after completed bus transactions.
4. System controller request memory controller to enter into self refresh mode.
5. System controller wait for self refresh acknowledge from memory controller.
6. Internal reset signals and nRSTOUT are asserted and reset counter is activated.
7. Reset counter is expired then, internal reset signals and nRSTOUT are deasserted.

#### 4.5 WAKEUP RESET

When S3C2451 is woken up from SLEEP mode by wakeup event, the wakeup reset is invoked. The detail description will be explained in the power management mode section.

Table 2-1 lists alive registers which are not influenced various reset sources except nRESET. With the exception of below registers (in table 2-1), All S3C2451's internal registers are reset by above-mentioned reset sources.

**Table 2-1. Registers & GPIO Status in RESET (R: reset, S: sustain previous value)**

| Region | Registers  | Software | Wakeup | Watchdog | nRESET |
|--------|--|----------|--------|----------|--------|
| SYSCON | OSCSET , PWRCFG, RSTCON, RSTSTAT, WKUPSTAT, INFORM0, INFORM1, INFORM2, INFORM3 | S        | S      | S        | R      |
| GPIO   | GPFCON, GPFUDP, GPFDAT, GPGCON[7:0], GPGUDP, GPGDAT[7:0], EXTINT0 ~ EXTINT15   | R        | S      | R        | R      |

## 5 CLOCK MANAGEMENT

### 5.1 CLOCK GENERATION OVERVIEW

Figure 2-3 shows the block diagram of the clock generation module. The main clock source comes from an external crystal (XTI) or external clock (EXTCLK). EPLL's input clock is one of the XTI or EXTCLK. Clock selection can be done by configuring MUX selection signal. When both XTI and EXTCLK are running, GFM(Glitch Free Mux)'s output can be configured easily without generating glitch. But if you change or select EPLL input clock when either XTI or EXTCLK is running, disabled clock should be have logic LOW.

XTI clock source can be reference of PLL after oscillated at PAD. User can configure stabilization time by setting OSCSET register and ON/OFF when power-down mode by setting PWRCFG register. The clock generator consists of two PLLs (Phase-Locked-Loop) which generate the high-frequency clock signals required in S3C2451.

Figure 2-3. Clock Generator Block Diagram

### 5.2 CLOCK SOURCE SELECTION

Table 2-2 and 2-3 show the relationship between the combination of mode control pins OM[0] and the selection of source clock for S3C2451.

Table 2-2. Clock source selection for the main PLL and clock generation logic

| OM[0] | MPLL Reference Clock<br>(Main clock source) |
|-------|---|
| 0     | XTI   |
| 1     | EXTCLK                                      |

Table 2-3. Clock Source Selection for the EPLL

| CLKSRC[8] (register) | CLKSRC[7] (register) | OM[0] | EPLL Reference Clock |
|----------------------|----------------------|-------|----------------------|
| 0                    | X                    | 0     | XTI                  |
| 0                    | X                    | 1     | EXTCLK               |
| 1                    | 0                    | X     | XTI                  |
| 1                    | 1                    | X     | EXTCLK               |

Table 2-4. PLL & Clock Generator Condition

| Loop filter capacitance                    | $C_{LF}$  | MPLLCAP : N/A                             |

Figure 2-4. Main Oscillator Circuit Examples

**5.3 PLL (PHASE-LOCKED-LOOP)**

The PLL (Phase-Locked Loop) frequency synthesizer is constructed in CMOS on single monolithic structure. The PLL provides frequency multiplication capabilities.

MPLL generates the clock sources for ARMCLK, HCLK, PCLK, DDRCLK and SSMCCLK and EPLL generates clock sources for USBHOSTCLK, CAMCLK and so forth.

The following sections describe the operation of the PLL, that includes the phase difference detector, charge pump, VCO (Voltage controlled oscillator), and loop filter.

Refer to MPLLCON and EPLLCON registers to change PLL output frequency.

**Figure 2-5. PLL(Phase-Locked Loop) Block Diagram**

**5.4 CHANGE PLL SETTINGS IN NORMAL OPERATION**

During the operation of S3C2451 in NORMAL mode, if the user wants to change the frequency by writing the PMS value, the PLL lock time is automatically inserted. During the lock time, the clock is not supplied to the internal blocks in S3C2451. The timing diagram is as follow.

**Figure 2-6. The Case that Changes Slow Clock by Setting PMS Value**

5.5 SYSTEM CLOCK CONTROL

The ARMCLK is used for ARM926EJ core, the main CPU of S3C2451. The HCLK is the reference clock for internal AHB bus and peripherals such as the memory controller, the interrupt controller, LCD controller, the DMA, USB host block, System Controller, Power down controller and etc. The PCLK is used for internal APB bus and peripherals such as WDT, IIS, I2C, PWM timer, ADC, UART, GPIO, RTC and SPI etc. DDRCLK is the data strobe clock for mDDR/DDR2 memories. CAMclk is used for camera interface block. HCLKCON and PCLKCON registers are used for clock gating of HCLK, PCLK respectively. SCLKCON register is responsible for EPLLclk clock gating on related modules.

Figure 2-7. The Clock Distribution Block Diagram

Figure 2-8 shows MPLL Based clock domain.

Figure 2-8. MPLL Based Clock Domain

## 5.6 ARM & BUS CLOCK DIVIDE RATIO

The MSysClk is the base clock for S3C2451 system clock, such as ARMCLK, HCLK, PCLK, DDRCLK, etc.

The Table 2-5 shows the clock division ratios between ARMCLK, HCLK and PCLK. This ratio is determined by ARMDIV, PREDIV, HCLKDIV and PCLKDIV bits of CLKDIV0 control register.

ARMCLK has to faster or equal with HCLK and synchronous. The Table 2-5 shows that DDRCLK, PCLK, ARMCLK divide ratio with regard HCLK ratio.

The fraction in the cell is ratio to MSysClk and the value in the round bracket means maximum frequency value.

**Table 2-5. Clock Division Ratio of MPLL Region**

| MSysClk<br>(800MHz) | HCLK<br>(133MHz) | DDRCLK<br>(266MHz) | PCLK, SSMC<br>(133MHz) | ARMCLK (533MHz)                 |
|---------------------|------------------|--------------------|------------------------|---------------------------------|
|                     | 1/1              | 1/1                | 1/1 or 1/2             | 1/1                             |
|                     | 1/2              | 1/1                | 1/2 or 1/4             | 1/1 or 1/2                      |
|                     | 1/3              | 1/1                | 1/3 or 1/6             | 1/1 or 1/3                      |
|                     | 1/4              | 1/2                | 1/4 or 1/8             | 1/1 or 1/2 or 1/4               |
|                     | 1/6              | 1/3                | 1/6 or 1/12            | 1/1 or 1/2 or 1/3 or 1/6        |
|                     | 1/8              | 1/4                | 1/8 or 1/16            | 1/1 or 1/2 or 1/4 or 1/8        |
|                     | 1/12             | 1/6                | 1/12 or 1/24           | 1/1 or 1/2 or 1/3 or 1/4 or 1/6 |
|                     | 1/16             | 1/8                | 1/16 or 1/32           | 1/1 or 1/2 or 1/4 or 1/8        |

HALKHCLK = 1'b1

Figure 2-9 shows EPLL and special clocks for various peripherals

Figure 2-9. EPLL Based Clock Domain

5.8 ESYSCLK CONTROL

Clocks of the EPLL can be used for various peripherals. Each divider value is configured in CLKDIV1 register and all clocks are enabled or disabled by accessing SCLKCON register. According to USB host interface, If you want to get the clock with exact 50% duty cycle, then make EPLL generate 96MHz and divide the clock.

EPLL will be turned off during STOP and SLEEP mode automatically. Also, EPLL will be generated clock to ESYSCLK, after exiting STOP and SLEEP mode if corresponding bits are enabled in SCLKCON register.

Table 2-6. ESYSCLK Control

| Condition              | ESYSCLK state   | EPLL state |
|------------------------|---|------------|
| After reset            | EPLL reference clock  | off        |

## 6 POWER MANAGEMENT

The power management block controls the system clocks by software for the reduction of power consumption in S3C2451. These schemes are related to PLL, clock control logic(ARMCLK, HCLK, PCLK) and wake-up signal. S3C2451 has four power-down modes. The following section describes each power management mode.

Related registers are PWRMODE, PWRCFG and WKUPSTAT.

### 6.1 POWER MODE STATE DIAGRAM

Figure 2-10 shows that Power Saving mode state and Entering or Exiting condition. In general, the entering conditions are set by the main CPU.

Figure 2-10. Power Mode State Diagram

## 6.2 POWER SAVING MODES

S3C2451 can support various power saving modes. These are Normal mode, idle mode, Stop mode, Deep-stop mode and Sleep mode.

### 6.2.1 Normal Mode (General Clock Gating Mode)

In General Clock Gating mode, the On/Off clock gating of the individual clock source of each IP block is performed by controlling of each corresponding clock source enable bit. The Clock Gating is applied instantly whenever the corresponding bit (or bits) is changed. (these bits are set or cleared by the main CPU.)

### 6.2.2 IDLE Mode

In IDLE mode, the clock to CPU core is stopped. To enter the idle mode, User must use ARM926EJ CP15 command (**MCR p15, 0, Rd, c7, c0, 4**). If user order this command, ARM core prepare to enter into power down mode. These are draining write buffer, letting memory system is in a quiescent state and confirming all external interface(AHB interface) is in idle state. After completing above operation, ARM asserted STANDBYWFI signal. So, System Controller of S3C2451 check STANDBYWFI signal is asserted and disabe ARM clock. By doing that, System can go into idle mode safely. To exit the idle mode, All interrupt sources, RTC ALARM, RTC Tick Counter, Battery Fault signal should be activated.

### 6.2.3 STOP mode (Normal and Deep-stop)

In STOP mode, all clocks are stopped for minimum power consumption. Therefore, the PLL and oscillator circuit are also stopped(oscillator circuit is stopped optionally, see PWRCFG register). The STOP Mode is activated after the execution of the STORE instruction that enables the STOP Mode bit. The STOP Mode bit should be cleared after the wake-up from the STOP state for the entering of next STOP Mode. The H/W logic only detects the low-to-high triggering of the STOP Mode bit.

In Deep-STOP mode ARM core's power is off by using internal power gating. By this way, the static current will be reduced remarkably compared with STOP mode. To enter the Deep-STOP mode, PWRMODE[18] register should be configured before entering STOP mode. After waking up from Deep-STOP mode, System controller resets ARM core only.

To exit from STOP mode, External interrupt, RTC alarm, RTC Tick, or nRESET has to be activated. During the wake-up sequences, the crystal oscillator and PLL may begin to operate. The crystal-oscillator settle-down-time and the PLL locking-time is required to provide stabilized ARMCLK. Those time-waits are automatically inserted by the hardware of S3C2451. During these time-waits, the clock is not supplied to the internal logic circuitry.

STOP mode Entering sequence is as follows

1. Set the STOP Mode bit (by the main CPU)
2. System controller requests bus controller to finish bus transactions of ARM Core.
3. System controller disable ARM clock after getting ARM Down acknowledge.
4. System controller requests bus controller to finish current transactions.
5. Bus controller send acknowledge to system controller after completed bus transactions.

6. System controller request memory controller to enter self refresh mode. It is for preserving contents in SDRAM.
7. System controller wait for self refresh acknowledge from memory controller.
8. After receiving the self-refresh acknowledge, system controller disables system clocks, and switches SYSCLK's source to MPLL reference clock.
9. Disables PLLs and Crystal(XTI) oscillation. If OSC\_EN\_STOP bit in PWRCFG register is 'high' then system controller doesn't disable crystal oscillation.
10. When PWRMODE[18] register is configured as '1' (Deep-STOP Enabled), ARM\_PWRENn signal change to enable ARM power gating. ARM Core is reset state during STOP mode.

STOP mode Exiting sequence is as follows

1. Enable X-tal Oscillator if it is used, and wait the OSC settle down (around 1ms).
2. After the Oscillator settle-down, the System Clock is fed using the PLL input clock and also enable the PLLs and waits the PLL locking time
3. Switching the clock source, now the PLL is the clock source.
4. When waking up from Deep-STOP mode, ARM\_PWRENn is restored to release ARM power gating. After producing SYSCLK ARM\_RESEn will be released to let ARM work normally.

**NOTE**

DRAM has to be in self-refresh mode during STOP and SLEEP mode to retain valid memory data. LCD must be stopped before STOP and SLEEP mode, because DRAM can't be accessed when it is in self-refresh mode.

#### 6.2.4 SLEEP MODE

In the SLEEP Mode, all the clock sources are off and also the internal logic-power is not supplied except for the wake-up logic circuitry. In this mode, the static power-dissipation of internal logic can be minimized.

SLEEP Mode Entering sequence is as follows.

1. User writes command into the system controller's PWRMODE[15:0] register to let system enter into the SLEEP Mode.
2. System controller requests bus controller to finish bus transactions of ARM Core.
3. System controller disable ARM clock after getting ARM Down acknowledge.
4. System controller requests bus controller to finish current transactions.
5. Bus controller send acknowledge to system controller after completed bus transactions.
6. System controller request memory controller to enter self refresh mode. It is for preserving contents in SDRAM.
7. System controller wait for self refresh acknowledge from memory controller.
8. After receiving the self-refresh acknowledge, System controller disable system clocks(HCLK, PCLK and so on).
9. System controller asserts control signals to mask unknown state of ALIVE logics and to preserve data of retention Pads.
10. System controller asserts PWR\_EN pin and disables the X-tal and PLL oscillation. PWR\_EN pin is used to indicate the readiness for external power OFF and to enable and disable of of the power regulator which produces internal-logic power.

SLEEP Mode Exiting sequence is as follows.

1. System controller enable external power source by deactivation of the PWR\_EN pin and wait power settle down time (it is programmable by a register in the PWRSETCNT field of RSTCON register).
2. System controller asserts HRESETn and consequently all bus down, self refresh requests and acknowledge signals will be their reset state.
3. System controller release the HRESETn(synchronously, relatively to the system clock) after the power supply is stabilized.

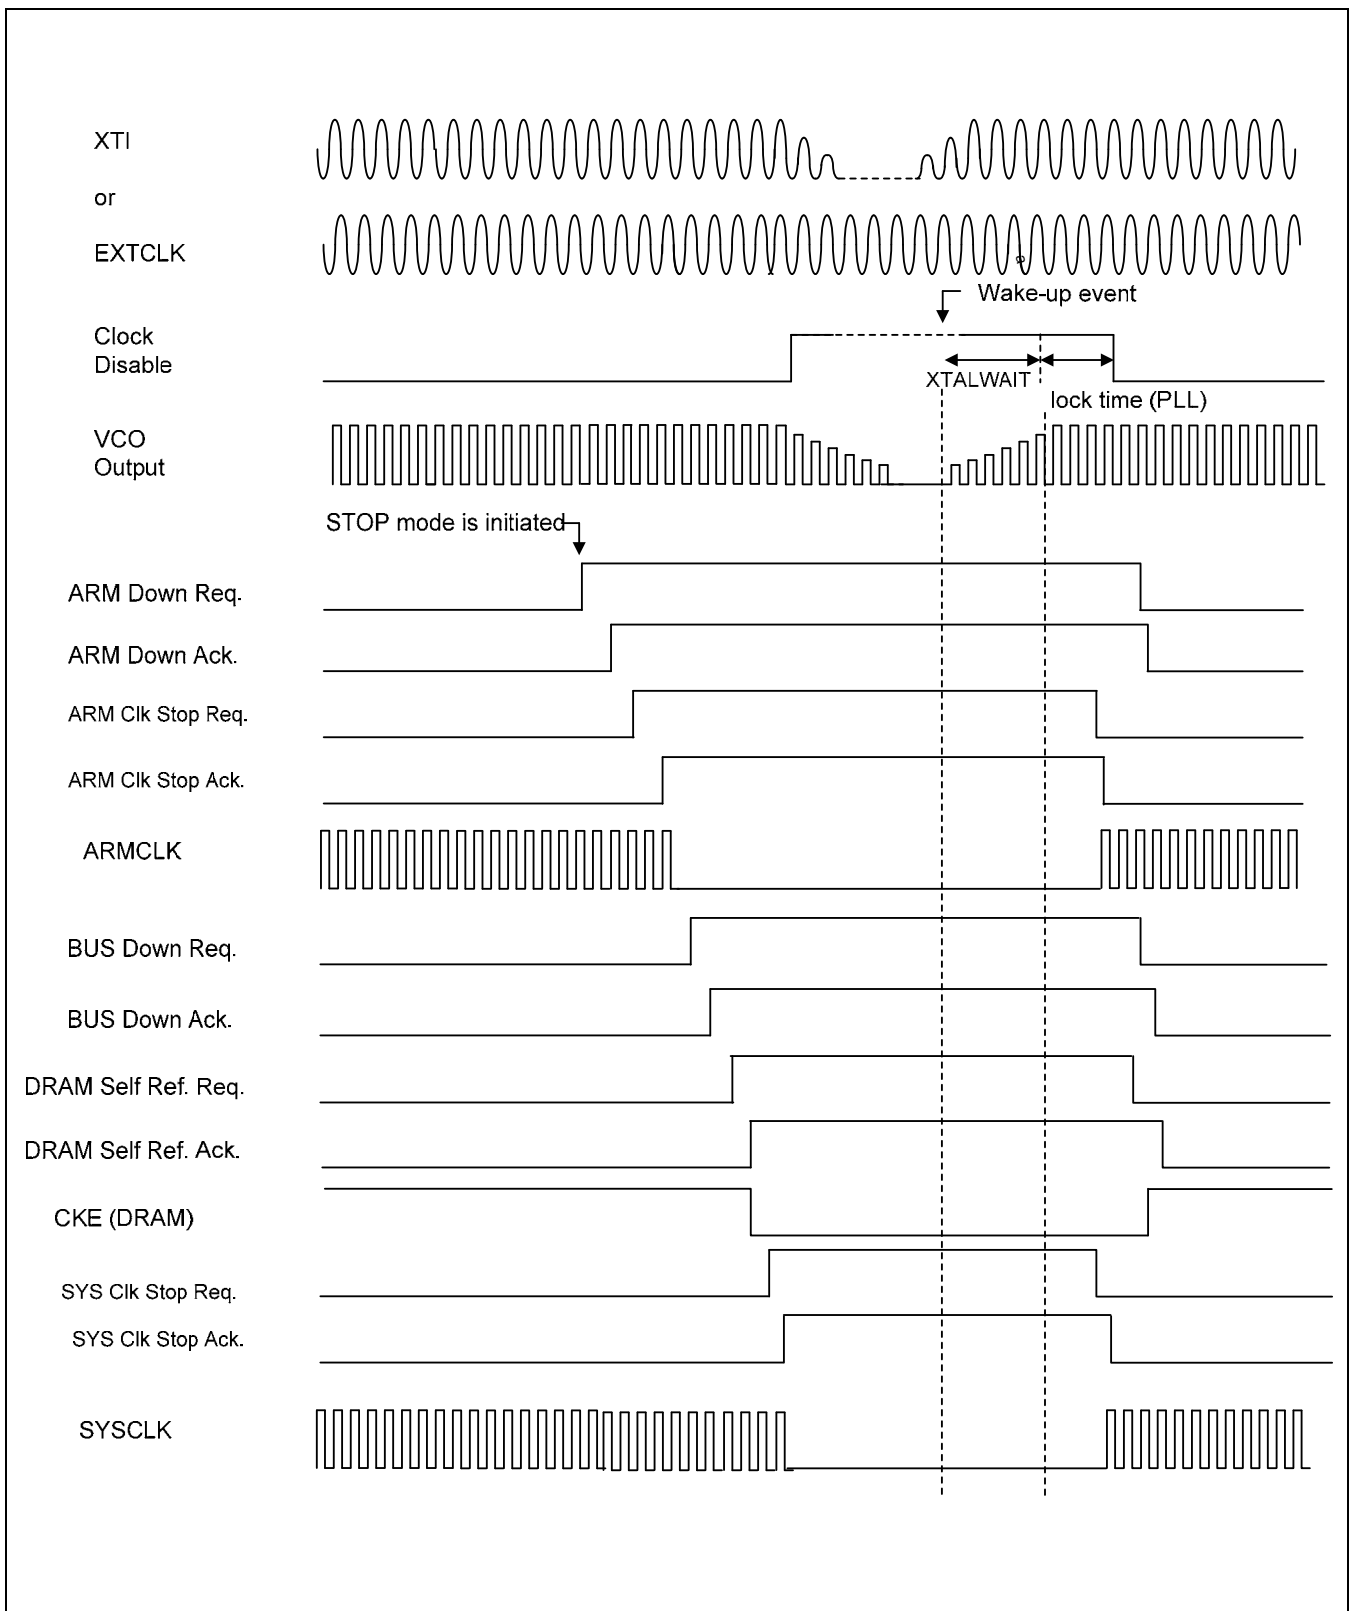

Figure 2-11. Entering STOP Mode and Exiting STOP Mode (wake-up)

Figure 2-12. Entering SLEEP Mode and Exiting SLEEP Mode (wake-up)

### 6.3 WAKE-UP EVENT

When S3C2451 wakes up from the STOP Mode by an External Interrupt, a RTC alarm interrupt and other interrupts, the PLL is turned on automatically. The initial-state of S3C2451 after wake-up from the SLEEP Mode is almost the same as the Power-On-Reset state except for the contents of the external DRAM is preserved. In contrast, S3C2451 automatically recovers the previous working state after wake-up from the STOP Mode. The following table shows the states of PLLs and internal clocks after wake-ups from the power-saving modes.

**Table 2-7. The Status of PLL and ARMCLK After Wake-up**

| Mode before wake-up | PLL on/off after wake-up                              | SYSCLK after wake-up and before the lock time | SYSCLK after the lock time by internal logic           |
|---------------------|---|---|--|
| IDLE                | Unchanged   | PLL output                                    | PLL output   |
| STOP                | PLL state ahead of entering STOP mode (PLL ON or not) | PLL reference clock                           | SYSCLK ahead of entering STOP mode (PLL output or not) |
| SLEEP               | Off   | PLL reference clock                           | PLL reference(input) clock                             |

### 6.4 OUTPUT PORT STATE AND STOP AND SLEEP MODE

Refer to GPIO chapter.

## 6.5 POWER SAVING MODE ENTERING/EXITING CONDITION

Table 2-8 shows that Power Saving mode state and Entering or Exiting condition. In general, the entering conditions are set by the main CPU.

Please refer to power-related registers (PWRMODE, PWRCFG and WKUPSTAT) before adopting power saving scheme on your system.

In dealing with sleep mode, it is good for you to know following two restrictions. To enter sleep mode by BATT\_FLT, you have to configure BATT\_CFG bits of PWRCFG register. Not to exit from sleep mode when BATT\_FLT is LOW, you have to configure SLEEP\_CFG bit of PWRCFG register.

**Table 2-8. Power Saving Mode Entering/Exiting Condition**

| Power down mode        | Enter  | Exit   |
|------------------------|--|--|
| Clock Gating at NORMAL | Clear a respective clock on/off bit for each IP to save power. | Set a respective clock on/off bit for each IP to operate normally  |
| IDLE                   | STANDBYWFI   | <ol style="list-style-type: none"> <li>1. All interrupt sources</li> <li>2. RTC alarm</li> <li>3. RTC Tick</li> <li>4. BATT_FLT</li> </ol>           |
| STOP                   | CMD  | <ol style="list-style-type: none"> <li>1. EINT[15:0] (External Interrupt)</li> <li>2. RTC alarm</li> <li>3. RTC Tick</li> <li>4. BATT_FLT</li> </ol> |
| SLEEP                  | CMD  | <ol style="list-style-type: none"> <li>1. EINT[15:0] (External Interrupt)</li> <li>2. RTC alarm</li> <li>3. RTC Tick</li> <li>4. BATT_FLT</li> </ol> |

## 7 REGISTER DESCRIPTIONS

The system controller registers are divided into seven categories; clock source control, clock control, power management, reset control, system controller status, bus configuration, and misc. The following section will describe the behavior of the system controller.

### 7.1 ADDRESS MAP

Table 2-9 summarizes the address map of the system controller.

**Table 2-9. System Controller Address Map**

| Register    | Address     | R/W | Description                               | Alive | Reset Value |
|-------------|-------------|-----|---|-------|-------------|
| LOCKCON0    | 0x4C00_0000 | R/W | MPLL lock time count register             | X     | 0x0000_FFFF |
| LOCKCON1    | 0x4C00_0004 | R/W | EPLL lock time count register             | X     | 0x0000_FFFF |
| OSCSET      | 0x4C00_0008 | R/W | Oscillator stabilization control register | O     | 0x0000_8000 |
| MPLLCON     | 0x4C00_0010 | R/W | MPLL configuration register               | X     | 0x0185_40C0 |
| EPLLCON     | 0x4C00_0018 | R/W | EPLL configuration register               | X     | 0x0120_0102 |
| EPLLCON_K   | 0x4C00_001C | R/W | EPLL configuration register for K value   | X     | 0x0000_0000 |
| CLKSRC      | 0x4C00_0020 | R/W | Clock source control register             | X     | 0x0000_0000 |
| CLKDIV0     | 0x4C00_0024 | R/W | Clock divider ratio control register0     | X     | 0x0000_000C |
| CLKDIV1     | 0x4C00_0028 | R/W | Clock divider ratio control register1     | X     | 0x0000_0000 |
| CLKDIV2     | 0x4C00_002C | R/W | Clock divider ratio control register2     | X     | 0x0000_0000 |
| HCLKCON     | 0x4C00_0030 | R/W | HCLK enable register                      | X     | 0xFFFF_FFFF |
| PCLKCON     | 0x4C00_0034 | R/W | PCLK enable register                      | X     | 0xFFFF_FFFF |
| SCLKCON     | 0x4C00_0038 | R/W | Special clock enable register             | X     | 0xFFFF_DFFF |
| PWRMODE     | 0x4C00_0040 | R/W | Power mode control register               | X     | 0x0000_0000 |
| SWRST       | 0x4C00_0044 | R/W | Software reset control register           | X     | 0x0000_0000 |
| BUSPRI0     | 0x4C00_0050 | R/W | Bus priority control register 0           | X     | 0x0000_0000 |
| PWRCFG      | 0x4C00_0060 | R/W | Power management configuration register   | O     | 0x0000_0000 |
| RSTCON      | 0x4C00_0064 | R/W | Reset control register                    | O     | 0x0006_0101 |
| RSTSTAT     | 0x4C00_0068 | R   | Reset status register                     | O     | 0x0000_0001 |
| WKUPSTAT    | 0x4C00_006C | R/W | Wake-up status register                   | O     | 0x0000_0000 |
| INFORM0     | 0x4C00_0070 | R/W | SLEEP mode information register 0         | O     | 0x0000_0000 |
| INFORM1     | 0x4C00_0074 | R/W | SLEEP mode information register 1         | O     | 0x0000_0000 |
| INFORM2     | 0x4C00_0078 | R/W | SLEEP mode information register 2         | O     | 0x0000_0000 |
| INFORM3     | 0x4C00_007C | R/W | SLEEP mode information register 3         | O     | 0x0000_0000 |
| USB_PHYCTRL | 0x4C00_0080 | R/W | USB PHY control register                  | X     | 0x0000_0000 |
| USB_PHYPWR  | 0x4C00_0084 | R/W | USB PHY power control register            | X     | 0x0000_0000 |
| USB_RSTCON  | 0x4C00_0088 | R/W | USB PHY reset control register            | X     | 0x0000_0000 |
| USB_CLKCON  | 0x4C00_008C | R/W | USB PHY clock control register            | X     | 0x0000_0000 |

## 8 INDIVIDUAL REGISTER DESCRIPTIONS

### 8.1 CLOCK SOURCE CONTROL REGISTERS (LOCKCON0, LOCKCON1, OSCSET, MPLLCON, AND EPLLCON)

The six registers control two internal PLLs and an external oscillator. The output frequency of the PLL is determined by the divider values of MPLLCON and EPLLCON. The stabilization time for PLLs and the oscillator is controlled by LOCKCON0/1 and OSCSET, respectively.

| Register  | Address     | R/W | Description                               | Reset Value |
|-----------|-------------|-----|---|-------------|
| LOCKCON0  | 0x4C00_0000 | R/W | MPLL lock time count register             | 0x0000_FFFF |
| LOCKCON1  | 0x4C00_0004 | R/W | EPLL lock time count register             | 0x0000_FFFF |
| OSCSET    | 0x4C00_0008 | R/W | Oscillator stabilization control register | 0x0000_8000 |
| MPLLCON   | 0x4C00_0010 | R/W | MPLL configuration register               | 0x0185_40C0 |
| EPLLCON   | 0x4C00_0018 | R/W | EPLL configuration register               | 0x0120_0102 |
| EPLLCON_K | 0x4C00_001C | R/W | EPLL configuration register for K value   | 0x0000_0000 |

Conventional PLL requires stabilization duration after the PLL is ON. The duration can be varied according to the device variation. Thus, software must adjust these fields with appropriate values in the LOCKCON0/1 register whose values mean the number of the external reference clock.

| LOCKCON0 | Bit     | Description   | Initial Value |
|----------|---------|---|---------------|
| RESERVED | [31:16] | RESERVED  | 0x0000        |
| M_LTIME  | [15:0]  | MPLL lock time count value for ARMCLK, HCLK, and PCLK<br>Typically, M_LTIME must be longer than 300 usec. | 0xFFFF        |

| LOCKCON1 | Bit     | Description   | Initial Value |
|----------|---------|---|---------------|
| RESERVED | [31:16] | RESERVED  | 0x0000        |
| E_LTIME  | [15:0]  | EPLL lock time count value for UARTCLK, SPICLK and etc.<br>Typically, E_LTIME must be longer than 300 usec. | 0xFFFF        |

In general, an oscillator requires stabilization time. This register specifies the duration based on the reference clock.

| OSCSET   | Bit    | Description   | Initial Value |
|----------|--------|---|---------------|
| RESERVED | [31:0] | RESERVED  | 0x0000        |
| XTALWAIT | [15:0] | Crystal oscillator settle-down wait time, this value is valid when s3c2451 is wakeup by stop mode | 0x8000        |

| MPLLCON     | Bit     | Description                           | Initial Value |
|-------------|---------|---------------------------------------|---------------|
| RESERVED    | [31:26] | -                                     | 0x00          |
| MPLLEN_STOP | [25]    | MPLL ON/OFF in STOP mode. 0:OFF, 1:ON | 0             |
| ONOFF       | [24]    | MPLL ON/OFF. 0:ON, 1:OFF              | 1             |
| MDIV        | [23:14] | Main divider value of MPLL            | 0x215         |
| RESERVED    | [13:11] | -                                     | 0x0           |
| PDIV        | [10:5]  | Pre-divider value of MPLL             | 0x6           |
| RESERVED    | [4:3]   | -                                     | 0x0           |
| SDIV        | [2:0]   | Post-divider value of MPLL            | 0x0           |

The output frequencies of **MPLL** can be calculated using the following equations:

$$F_{OUT} = (m \times F_{IN}) / (p \times 2^s) \quad (\text{should be } 40\sim 1600\text{MHz})$$

$$F_{vco} = (m \times F_{IN}) / p \quad (\text{should be } 800\sim 1600\text{MHz})$$

where, m = MDIV, p = PDIV, s = SDIV, Fin = 10~30Mhz

Don't set the value PDIV[5:0] or MDIV[9:0] to all zeros. (6'b00 0000 / 10'b00 0000 0000)

#### NOTE

Although there is the equation for choosing PLL value, we strongly recommend only the values in the PLL value recommendation table. If you have to use other values, please contact us.

| FIN (MHz) | Target FOUT (MHz) | MDIV (decimal) | PDIV (decimal) | SDIV (decimal) | Duty   |
|-----------|-------------------|----------------|----------------|----------------|--------|
| 12        | 240               | 320            | 4              | 2              | 40~60% |
| 12        | 400               | 400            | 3              | 2              | 40~60% |
| 12        | 450               | 225            | 3              | 1              | 40~60% |
| 12        | 500               | 250            | 3              | 1              | 40~60% |
| 12        | 534               | 267            | 3              | 1              | 40~60% |
| 12        | 600               | 300            | 3              | 1              | 40~60% |
| 12        | 800               | 400            | 3              | 1              | 40~60% |

| EPLLCON     | Bit     | Description                           | Initial Value |
|-------------|---------|---------------------------------------|---------------|
| RESERVED    | [31:26] | -                                     | 0x00          |
| EPLLEN_STOP | [25]    | EPLL ON/OFF in STOP mode. 0:OFF, 1:ON | 0             |
| ONOFF       | [24]    | EPLL ON/OFF. 0:ON, 1:OFF              | 1             |
| MDIV        | [23:16] | EPLL main divider value               | 0x20          |
| RESERVED    | [15:14] | -                                     | 0x0           |
| PDIV        | [13:8]  | EPLL pre-divider value                | 0x1           |
| RESERVED    | [7:3]   | -                                     | 0x00          |
| SDIV        | [2:0]   | EPLL post-scaler value                | 0x2           |

| EPLLCON_K | Bit     | Description               | Initial Value |
|-----------|---------|---------------------------|---------------|
| RESERVED  | [31:16] | -                         | 0             |
| KDIV      | [15:0]  | EPLL fractional modulator | 0x0000        |

The output frequencies of **EPLL** can be calculated using the following equations:

$$F_{OUT} = ((m+k/2^{16}) \times F_{IN}) / (p \times 2^s) \text{ (should be 20~600MHz)}$$

$$F_{VCO} = (m \times F_{IN}) / p$$

where, m = MDIV, p = PDIV, s = SDIV, k = KDIV Fin = 10~40MHz

Don't set the value PDIV[5:0] or MDIV[7:0] to all zeros. (6'b00 0000 / 8'b0000 0000)

#### NOTE

Although there is the equation for choosing PLL value, we strongly recommend only the values in the PLL value recommendation table. If you have to use other values, please contact us.

| FIN (MHz) | FOUT (MHz) | MDIV (decimal) | PDIV (decimal) | SDIV (decimal) | KDIV (decimal) | Error [MHz] |
|-----------|------------|----------------|----------------|----------------|----------------|-------------|

## 8.2 CLOCK CONTROL REGISTER (CLKSRC, CLKDIV, HCLKCON, PCLKCON, AND SCLKCON)

The clock generator within the system controller has many dividers and MUXs to generate appropriate clocks. These clocks are controlled by the clock control registers as described in here.

| Register | Address     | R/W | Description                           | Reset Value |
|----------|-------------|-----|---------------------------------------|-------------|
| CLKSRC   | 0x4C00_0020 | R/W | Clock source control register         | 0x0000_0000 |
| CLKDIV0  | 0x4C00_0024 | R/W | Clock divider ratio control register0 | 0x0000_000C |
| CLKDIV1  | 0x4C00_0028 | R/W | Clock divider ratio control register1 | 0x0000_0000 |
| CLKDIV2  | 0x4C00_002C | R/W | Clock divider ratio control register2 | 0x0000_0000 |
| HCLKCON  | 0x4C00_0030 | R/W | HCLK enable register                  | 0xFFFF_FFFF |
| PCLKCON  | 0x4C00_0034 | R/W | PCLK enable register                  | 0xFFFF_FFFF |
| SCLKCON  | 0x4C00_0038 | R/W | Special clock enable register         | 0xFFFF_DFFF |

The CLKSRC selects the source input of the clocks.

| RESERVED   | [2:0]   | -  | 0x0           |

The CLKDIV0 configures the division ratio of each clock generator. The operating speed of ARM can be slow to reduce the overall power dissipation, if software does not require full operating performance. In this case, the power dissipation due to the ARM core can be reduced if the DVS field is ON. The set of DVS field makes that the operating frequency of ARM is the same as system operating clock (HCLK).

| CLKDIV0  | Bit     | Description   | Initial Value |

| PCLKDIV  | [2]     | PCLK clock divider ratio, 0 = HCLK, 1 = HCLK / 2  | 1             |
| HCLKDIV  | [1:0]   | HCLK clock divider ratio<br>HCLKDIV value should be one of 0,1,3. (2'b10 is invalid)  | 0x0           |

ARMCLK Ratio = (ARMDIV+1).

HCLK Ratio = (PREDIV+1) \* (HCLKDIV + 1)

Restrictions about changing ARMDIV register.

1. Be careful that ARMCLK should be equal or faster than HCLK. (X times, X is integer)
2. Change PREDIV, HCLKDIV field after 12 HCLK periods as soon as nRESET is released.

Basically, Changing ARMDIV and HCLKDIV simultaneously is supported. When modifying ARMDIV, PREDIV and HCLKDIV, User should pay attention to obey upper No 1 restriction.

CLKDIV1 configures the clock ratio related on EPLL.

### 8.3 POWER MANAGEMENT REGISTERS (PWRMODE AND PWRCFG)

If you want to change the power management mode, you just write a bit(s) into PWRMODE register. Before writing, you must configure condition to wake-up from the power down mode.

| Register | Address     | R/W | Description                             | Reset Value |
|----------|-------------|-----|---|-------------|
| PWRMODE  | 0x4C00_0040 | R/W | Power mode control register             | 0x0000_0000 |
| PWRCFG   | 0x4C00_0060 | R/W | Power management configuration register | 0x0000_0000 |

S3C2451 consists of three power-down modes, which are IDLE, STOP, and SLEEP. The mode transition from the NORMAL mode occurs when the appropriate value is written into PWRMODE register. If software tries to write illegal value, i.e., tries to set multiple power modes concurrently, then the write operation will be ignored.

| PWRMODE  | Bit     | Description  | Initial Value |
|----------|---------|--|---------------|
| RESERVED | [31:17] | RESERVED   | 0             |
| STOP     | [16]    | The system enters into STOP mode when this field is set to '1'.  | 0             |
| SLEEP    | [15:0]  | The system enters into SLEEP mode when this field is set to '0x2BED'. The bit pattern, '0x2BED', represents "Go To BED". | 0             |

PWRCFG register controls the configuration of power mode transition.

| PWRCFG        | Bit     | Description   | Initial Value |

#### 8.4 RESET CONTROL REGISTERS (SWRST AND RSTCON)

Software can reset S3C2451 using SWRST register. The waveform of the reset signals are determined by RSTCON register.

| Register | Address     | R/W | Description                     | Reset Value |
|----------|-------------|-----|---------------------------------|-------------|
| SWRST    | 0x4C00_0044 | R/W | Software reset control register | 0x0000_0000 |
| RSTCON   | 0x4C00_0064 | R/W | Reset control register          | 0x0006_0101 |

When software write the predefined value, 0x533C2451, into SWRST register, then the system controller asserts internal reset signal and initializes internal state.

| SWRST | Bit    | Description   | Initial Value |
|-------|--------|---|---------------|
| SWRST | [31:0] | If this field has 0x533C2451, then the system will restart. | 0x0000_0000   |

RSTCON register controls the duration of the system reset signal.

| RSTCON     | Bit     | Description  | Initial Value |
|------------|---------|--|---------------|
| RESERVED   | [31:19] | -  | 0x0000        |
| RESERVED   | [18:17] | Should be set '0x3'  | 0x3           |
| PWROFF_SLP | [16]    | Power Control on pad retention cell I/O.<br>Retention cell I/O's power will be off when sleep mode, but when wakeup process starts, User should write '1' to produce power on retention I/O (see below detailed description)<br>1 = set automatically when sleep mode.<br>0 = cleared by user writing '1'  | 0             |
| RSTCNT     | [15:8]  | Only watch dog and software reset can start counter which is counted from RSTCNT value. This RSTCNT value effects delay of releasing reset. After this counter expired, internal reset (like HRESETn) will be HIGH state.<br>Range which user can configure is from 0x01 to 0xFE.<br>(Don't write 0xFF to this field)  | 0x01          |
| PWRSETCNT  | [7:0]   | This field configures value of Power Settle Down Counter.<br>Only When waking up from sleep mode, Power Settle Down Counter starts counting to wait for stability of external voltage source. As soon as counter reaches PWRSETCNT value, the system escapes from sleep mode.<br>Range which user can configure is from 0x01 to 0xFE.<br>(Don't write 0xFF to this field)<br>Real count number = (PWRSETCNT[7:0] + 1) * 2048 | 0x01          |

## 8.5 CONTROL OF RETENTION PAD(I/O) WHEN NORMAL MODE AND WAKE-UP FROM SLEEP MODE.

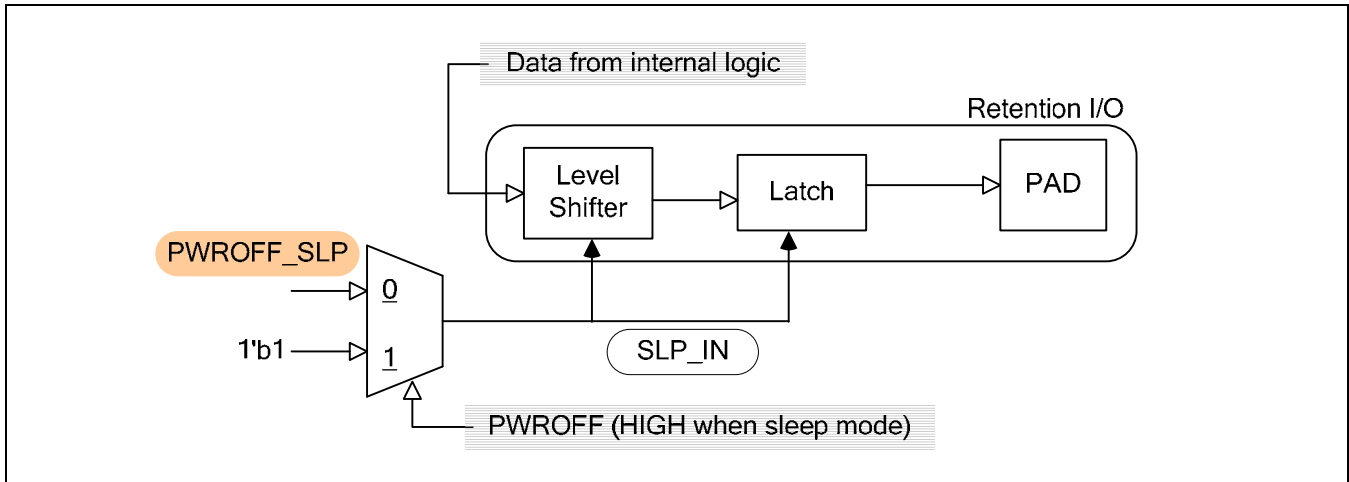

Figure 2-13. Usage of PWROFF\_SLP

S3C2451 has a lot of retention PADs. Retention pad's ability is remaining data when internal logic power is off. In normal mode, PWROFF\_SLP signal which from RSTCON register can control about PAD output. If SLP\_IN signal has LOW value, data assigned to specific PAD go out through level shifter and latch. Otherwise If SLP\_IN signal has HIGH value, output of level shifter cannot pass therefore retention PAD produces latched data only.

When the system enters into a sleep mode, SLP\_IN value has HIGH value as a result of PWROFF's HIGH state. Furthermore, PWROFF\_SLP register bit is automatically set to 1'b1.

When the system wakeup from sleep mode, SLP\_IN still remains HIGH state until user configure PWROFF\_SLP bit as 1'b0. Therefore, user has to configure PWROFF\_SLP bit to produce internal logic data through PAD after waking up from sleep mode.

## 8.6 SYSTEM CONTROLLER STATUS REGISTERS (WKUPSTAT AND RSTSTAT)

Software must know the status of the system controller after wakeup or reset. WKUPSTAT and RSTSTAT registers store the information.

| Register | Address     | R/W | Description             | Reset Value |
|----------|-------------|-----|-------------------------|-------------|
| RSTSTAT  | 0x4C00_0068 | R   | Reset status register   | 0x0000_0001 |
| WKUPSTAT | 0x4C00_006C | R/W | Wake-up status register | 0x0000_0000 |

After S3C2451 is re-set or woken-up, the following two registers store the source of the activation. The value of RSTSTAT register is cleared by the other reset. If each bit has '1' value, resets or wakeup events are occurred.

The reset priority is as follows: nRESET > WDTRST > SLEEP > DEEP-STOP > SW Reset

| RSTSTAT   | Bit    | Description  | Initial Value |
|-----------|--------|--|---------------|
| RESERVED  | [31:6] | -  | 0x0000_000    |
| SWRST     | [5]    | Reset by software (see SWRST register)   | 0             |
| DEEP-STOP | [4]    | Wakeup from DEEP-STOP (ARM Reset only)   | 0             |
| SLEEP     | [3]    | Wakeup from RTC_TICK, RTC_ALARM, EINT and battery fault from power-down mode. (Reset by waking-up from SLEEP mode) | 0             |
| WDTRST    | [2]    | Reset by Watch-dog reset   | 0             |
| RESERVED  | [1]    | -  | 0             |
| EXTRST    | [0]    | External reset by nRESET pin   | 1             |

WKUPSTAT register indicates that which source was used for changing system state into normal mode from idle, stop and sleep mode. The value of WKUPSTAT register can be cleared by writing '1'.

| WKUPSTAT | Bit    | Description  | Initial Value |
|----------|--------|--|---------------|
| RESERVED | [31:6] | -  | 0x0000_000    |
| BATF     | [5]    | Waked-up by BATT_FLT assertion. This field is valid when PWRCFG[1:0] = 2'b01 | 0             |
| RTC_TICK | [4]    | Waked-up by RTC tick   | 0             |
| RESERVED | [3:2]  | -  | 0x0           |
| RTC      | [1]    | Waked-up by RTC alarm  | 0             |
| EINT     | [0]    | Waked-up by external interrupts  | 0             |

## 8.7 BUS CONFIGURATION REGISTER (BUSPRI0, BUSPRI1, AND BUSMISC)

To improve AHB bus performance, software must control the arbitration scheme and type.

| Register | Address     | R/W | Description                     | Reset Value |
|----------|-------------|-----|---------------------------------|-------------|
| BUSPRI0  | 0x4C00_0050 | R/W | Bus priority control register 0 | 0x0000_0000 |

S3C2451 consists of 2 hierarchical AHB buses. The arbitration priority and order can be configured with BUSPRI0 registers. You can see specific priority number that assigned to each AMBA master in User's Manual section '04-BUS PRIORITIES'. The number of masters of AHB-S and AHB-I bus is 16 and 9 respectively.

Each TYPE field of BUSPRI0 register has three possible choices as follows:

1. 2'b00: the fixed type
2. 2'b01: the last granted maser has the lowest priority
3. 2'b10: the rotated type
4. 2'b11: undefined

| BUSPRI0  | Bit                                   | Description   | Initial Value                         |                                       |          |                                       |          |      |                                       |      |                                       |      |                                       |      |                                       |      |                                       |      |                                       |      |                              |      |                                       |      |                                       |      |                                       |      |                                       |      |                                       |      |                                       |      |                                       |      |                                       |      |                                       |

# 3 BUS MATRIX & EBI

## 1 OVERVIEW

S3C2451 MATRIX provides the interface between dual AHB bus and Memory sub-system. It is used for achieving high system performance by accessing various kinds of memory (SDRAM, SRAM, Flash Memory, ROM etc) from different AHB bus (one is for system and the other is for image) at the same time. S3C2451 have two MATRIX cores because it has two memory ports, and each MATRIX can select the priority between rotation type and fixed type. User can select which one is excellent for improving system performance.

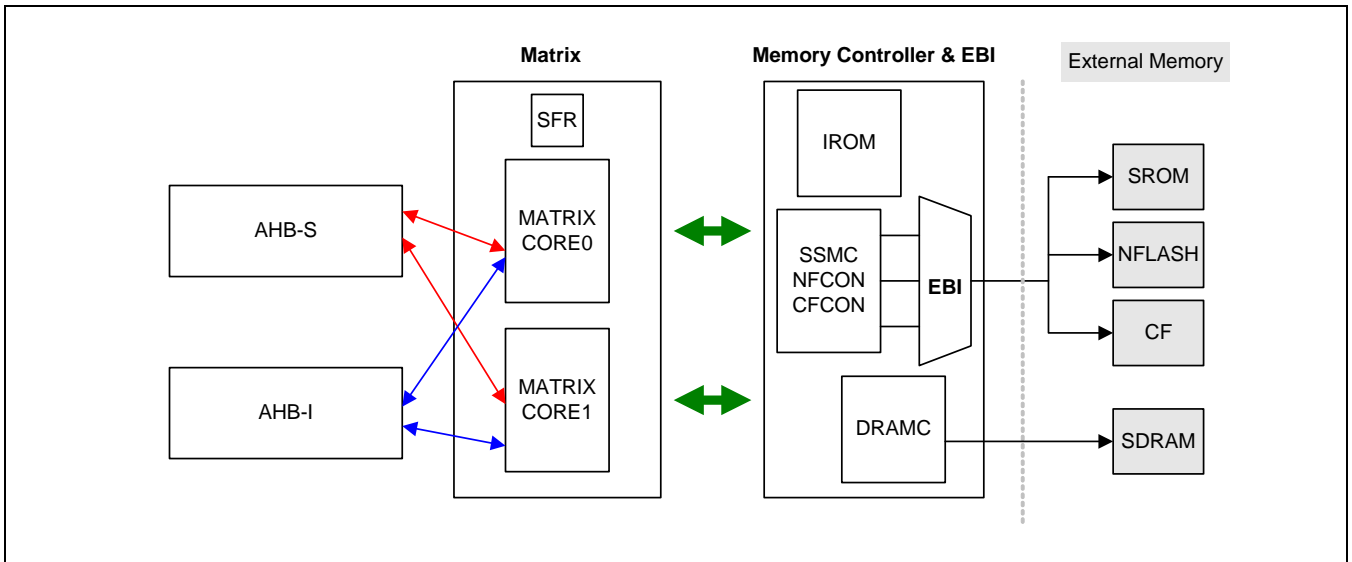

Figure 3-1. The Configuration of MATRIX and Memory Sub-System of S3C2451

## 2 SPECIAL FUNCTION REGISTERS

### 2.1 MATRIX CORE 0 PRIORITY REGISTER (BPRIORITY0)

| Register   | Address    | R/W | Description                             | Reset Value |
|------------|------------|-----|---|-------------|
| BPRIORITY0 | 0X4E800000 | R/W | Matrix Core 0 priority control register | 0x0000_0004 |

| BPRIORITY0  | Bit | Description  | Initial State |
|-------------|-----|--|---------------|
| PRI_TYP     | [2] | Priority type<br>0 = Fixed Type<br>1 = Rotation Type                           | 1             |
| FIX_PRI_TYP | [0] | Priority for the fixed priority type<br>0 = AHB_S > AHB_I<br>1 = AHB_I > AHB_S | 0             |

### 2.2 MATRIX CORE 1 PRIORITY REGISTER (BPRIORITY1)

| Register   | Address    | R/W | Description                             | Reset Value |
|------------|------------|-----|---|-------------|
| BPRIORITY1 | 0X4E800004 | R/W | Matrix Core 1 priority control register | 0x0000_0004 |

| BPRIORITY1  | Bit | Description  | Initial State |
|-------------|-----|--|---------------|
| PRI_TYP     | [2] | Priority type<br>0 = Fixed Type<br>1 = Rotation Type                           | 1             |
| FIX_PRI_TYP | [0] | Priority for the fixed priority type<br>0 = AHB_S > AHB_I<br>1 = AHB_I > AHB_S | 0             |

## 2.3 EBI CONTROL REGISTER (EBICON)

| Register | Address    | R/W | Description          | Reset Value |
|----------|------------|-----|----------------------|-------------|
| EBICON   | 0X4E800008 | R/W | EBI control register | 0x0000_0004 |

| EBICON      | Bit   | Description  | Initial State |
|-------------|-------|--|---------------|
| BANK3_CFG   | [10]  | Bank3 Configuration<br>0 = SROM<br>1 = CF  | 0             |
| BANK2_CFG   | [9]   | Bank2 Configuration<br>0 = SROM<br>1 = CF  | 0             |
| BANK1_CFG   | [8]   | Bank1 Configuration<br>0 = SROM<br>1 = NAND  | 0             |
| PRI_TYP     | [2]   | Priority type<br>0 = Fixed Type<br>1 = Rotation Type   | 1             |
| FIX_PRI_TYP | [1:0] | Priority for the fixed priority type<br>0 = SSMC > NFCON > CFCON > ExtBusMaster<br>1 = SSMC > CFCON > NFCON > ExtBusMaster<br>2 = SSMC > ExtBusMaster > NFCON > CFCON<br>3 = ExtBusMaster > SSMC > NFCON > CFCON | 00            |

NOTES

# 4 BUS PRIORITIES

## 1 OVERVIEW

The bus arbitration logic determines the priorities of bus masters. It supports a combination of rotation priority mode and fixed priority mode.

### 1.1 BUS PRIORITY MAP

The S3C2451 holds 16 masters on the AHB\_S(System Bus), 9 masters on the AHB\_I(Image Bus) and 9 masters on the APB Bus. The following list shows the priorities among these bus masters after a reset.

| Priority | AHB_S BUS MASTERS | Comment  |
|----------|-------------------|--|
| 0        | CF                | 1. Fix Type: all priority can be changed according to register value stored in The System Controller.  |
| 1        | HS-MMC1           |  |
| 2        | DMA0              | 2 Rotation Type: all masters' priority can be rotatable according to register value stored in The System Controller.<br>(Except for Default Masters) |
| 3        | DMA1              |  |
| 4        | DMA2              |  |
| 5        | DMA3              |  |
| 6        | DMA4              |  |
| 7        | DMA5              |  |
| 8        | DMA6              |  |
| 9        | DMA7              |  |
| 10       | UHOST             |  |
| 11       | UDEVICE20         |  |
| 12       | HS-MMC0           |  |
| 13       | ARM926EJ DBUS     |  |
| 14       | ARM926EJ IBUS     |  |
| 15       | Default           |  |

| Priority | AHB_I BUS MASTERS | Comment  |
|----------|-------------------|--|
| 0        | Reserved          | 1. Fix Type: all priority can be changed according to register value stored in The System Controller.<br><br>2 Rotation Type : all masters' priority can be rotatable according to register value stored in The System Controller.<br>( except for Default Master) |
| 1        | TFTW1-LCD         |  |
| 2        | TFTW2-LCD         |  |
| 3        | CAMIF_PREVIEW     |  |
| 4        | CAMIF_CODEC       |  |
| 5        | CAMIF_PIP         |  |
| 6        | 2D                |  |
| 7        | AHB2AHB           |  |
| 8        | Default           |  |

| Priority | APB BUS MASTERS | Comment   |
|----------|-----------------|---|
| 0        | AHB2APB         | AHB2APB Bridge Master obtains always highest priority and the priority of six DMA channels rotate internally. |
| 1        | DMA0            |   |
| 2        | DMA1            |   |
| 3        | DMA2            |   |
| 4        | DMA3            |   |
| 5        | DMA4            |   |
| 6        | DMA5            |   |
| 7        | DMA6            |   |
| 8        | DMA7            |   |

# 5

## STATIC MEMORY CONTROLLER (SMC)

### 1 OVERVIEW

The SMC provides simultaneous support for up to six memory banks (bank0 to bank5) that you can configure independently. Each memory bank supports:

- SRAM
- ROM
- Flash EPROM
- Burst SRAM, ROM, and flash
- OneNAND

You can configure each memory bank to use 8 or 16-bit external memory data paths. You can configure the SMC to support either little-endian or big-endian operation. For example, each memory bank can be configured to support:

- nonburst read and write accesses to high-speed CMOS asynchronous static RAM
- nonburst write accesses, nonburst read accesses, and asynchronous page mode read accesses to fast-boot block flash memory
- synchronous single and burst read and write accesses to synchronous static RAM.

## 2 FEATURE

- Supports asynchronous static memory-mapped devices including RAM, ROM, OneNAND and flash
- Supports synchronous static memory-mapped devices including synchronous burst flash
- Supports asynchronous page mode read operation in non-clocked memory subsystems
- Supports asynchronous burst mode read access to burst mode ROM and flash devices
- Supports synchronous burst mode read, write access to burst mode ROM and flash devices
- Supports 8 and 16-bit data bus
- Address space : Up to 64MB per Bank
- Fixed memory bank start address
- External wait to extend the bus cycle
- Support byte, half-word and word access for external memory
- Programmable wait states, up to 31
- Programmable bus turnaround cycles, up to 15
- Programmable output enable and write enable delays, up to 15
- Configurable size at reset for boot memory bank using external control pins
- Support for interfacing to another memory controller using an External Bus Interface (EBI)
- Multiple memory clock frequencies available, HCLK and HCLK/2
- Eight word, 32-bit, wrapping reads from 16-bit memory
- SMBSTWAIT is synchronous burst wait input that the external device uses to delay a synchronous burst transfer for bank 0. When this signal is not used, it shall be driven to high.
- nWAIT is wait mode input from external memory controller. Active HIGH or active LOW, as programmed in the SMC Control Registers for each bank.

3 BLOCK DIAGRAM

Figure 5-1. SMC Block Diagram

Figure 5-2. SMC Core Block Diagram

3.1 ASYNCHRONOUS READ

Figure 5-3 shows an external memory read transfer with two output enable delay states,  $WSTOEN = 2$ , and two wait states,  $WSTRD = 2$ . Four AHB wait states are inserted during the transfer, two for the standard read, and additional two because of the programmed wait states added.

The PSMAVD signal might be required for synchronous static memory devices when you use it in asynchronous mode. You can disable this using the AddrValidReadEn bit in the SMBCRx register. This bit defaults to being set (enable) to enable a system to boot from synchronous memory. You can then clear it if you do not require it. When disabled, the signal is driven HIGH continuously.

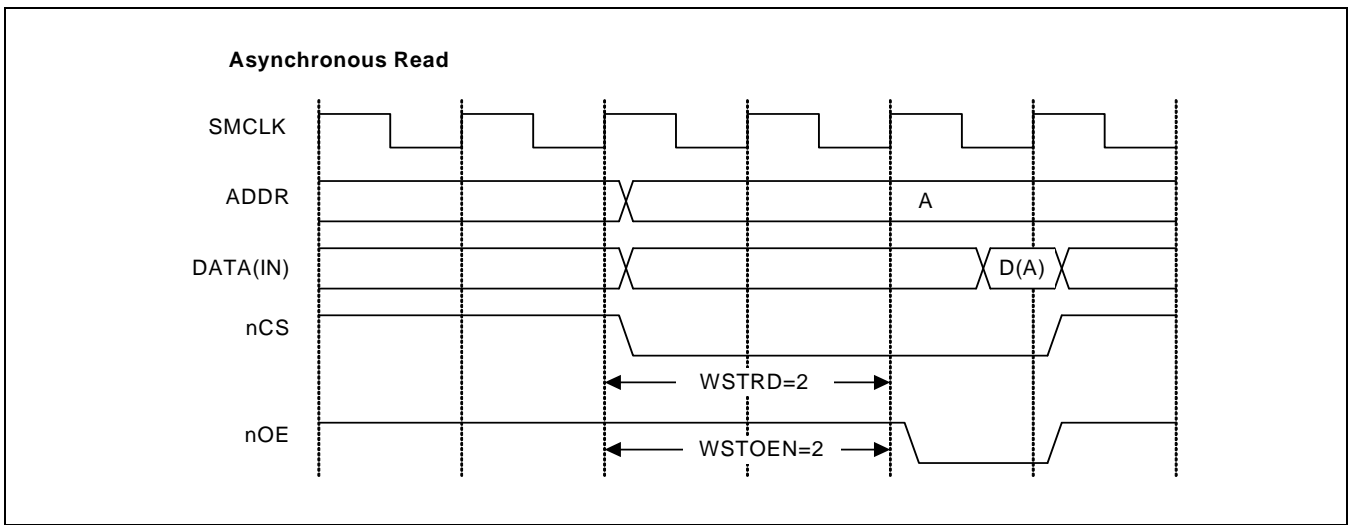

Figure 5-3. External Memory Two Output Enable Delay State Read

Figure 5-4. Read Timing Diagram ( $DRnCS = 1$ ,  $DRnOWE = 0$ )

Figure 5-5. Read Timing Diagram (DRnCS = 1, DRnOWE = 1)

3.2 SYNCHRONOUS READ/SYNCHRONOUS BURST READ

Single synchronous read operations have the same control signal timing as an asynchronous read operation, but with different timing requirements for setup and hold relative to the clock. Because the output signals of the SMC are generated internally from clocked logic, the timing for single synchronous reads is the same as for asynchronous reads.

Synchronous burst read transfers are performed differently to asynchronous burst reads, because of the internal address incrementing performed by synchronous burst devices. The PADDR outputs are held with the initial address value, and the PSMAVD output is asserted during the transfer to indicate that the address is valid.

Four, eight, or continuous synchronous burst lengths are supported, and are controlled by the BurstLenRead bits in the Bank Control Register SMBCRx when the SyncEnRead and BMRead bits indicate that the device supports synchronous bursts.

Figure 5-6 shows continuous burst read transfers, where WSTRD = 3 and WSTBRD = 0.

Figure 5-6. External Synchronous Fixed Length Four Transfer Burst Read

### 3.3 ASYNCHRONOUS WRITE

You can program the delay between the assertion of the chip select and the write enable from 0-15 cycles using the WSTWEN bits of the Bank Write Enable Assertion Delay Control Register, SMBWSTWENRx. This reduces the power consumption for memories. The write enable is asserted on the rising edge of nSMEMCLK, half a clock after the assertion of chip select.

For most asynchronous memory devices an SMEMCLK cycle is required before the assertion of nWE otherwise there is the hazard that nCS changes after nWE. You can add extra cycles before nWE is asserted using the WSTWEN bits in the Bank Write Enable Assertion Delay Control Registers. For example, setting WSTWR=WSTWEN=1 extends the transfer by one cycle and delays the assertion of nWE by one cycle.

The Write enable is always deasserted half a cycle before the chip select, at the end of the transfer. nSMBLS has the same timing as nSMWEN for writes to 8-bit devices that use the byte lane selects instead of the write enables.

The WSTWEN programmed value must be equal to, or less than the WSTWR programmed value otherwise an invalid access sequence is generated. The access is timed by the WSTWR value and not by the WSTWEN value.

In the External Wait enabled mode, the timing of the transfer (controlled by SMWAIT) is not known. WSTWEN still delays the assertion of nSMWEN. nSMWEN is delayed more by the external wait signal if it has not been asserted when SMWAIT is asserted.

You might require the SMADDRVALID signal for synchronous static memory devices when you use it in asynchronous mode. You can disable it using the AddrValidWriteEn bit in the SMBCRx Register. This bit defaults to being set(enable). You can then clear it if you do not require it. When you disable it, the signal is driven HIGH continuously.

Figure 5-7 shows a single external memory write transfer with two write enable delay states, WSTEN=2, and two wait states, WSTWR=2. A single AHB wait state is inserted.

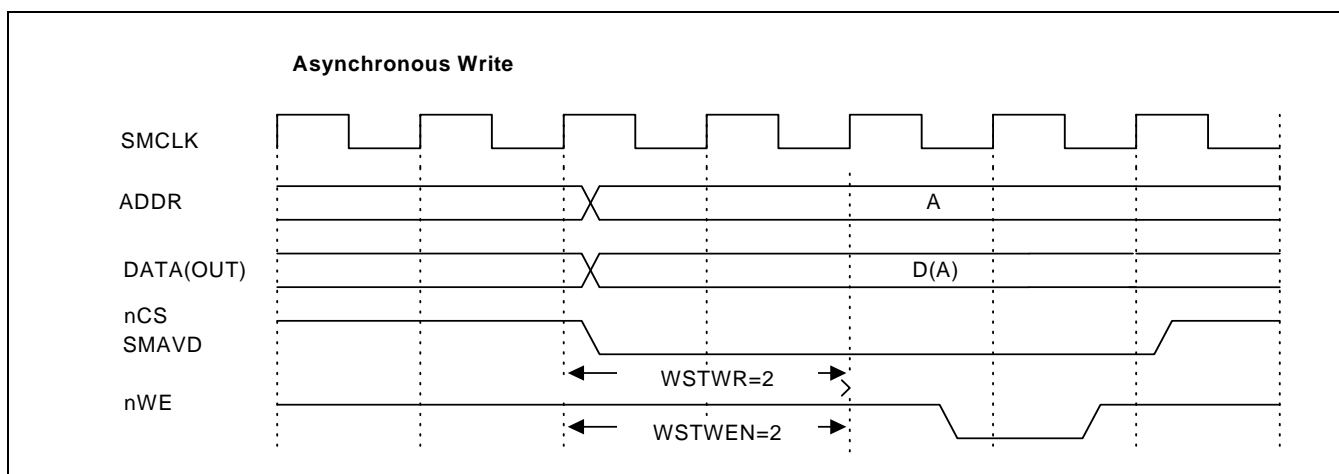

Figure 5-7. External Memory Two Write Enable Delay State Write

Figure 5-8. Write Timing Diagram (DRnCS = 1, DRnOWE = 0)

Figure 5-9. Write Timing Diagram (DRnCS = 1, DRnOWE = 1)

### 3.4 SYNCHRONOUS WRITE/ SYNCHRONOUS BURST WRITE

Figure 5-10 shows an example synchronous write operation. In this example the signal SMADDRVALID provides a one-cycle pulse. This behavior is enabled by setting the SyncWriteDev bit in the SMBCRx register. You must also set the AddrValidWriteEn bit for synchronous write.

The signal PnWE is only active for one cycle. This is active at the start of the transfer unless it is delayed using the control bits WSTWEN to delay it.

Synchronous burst writes are supported by the SMC. There is no write buffer so you must delay the AHB transfer to enable the data to be output onto the SMDATA bus. You can control the write in the same way as reads using the bits AddrValidWriteEn, BurstLenWrite, SyncEnWrite, and BMWrite contained in the Bank Control Register, SMCRx.

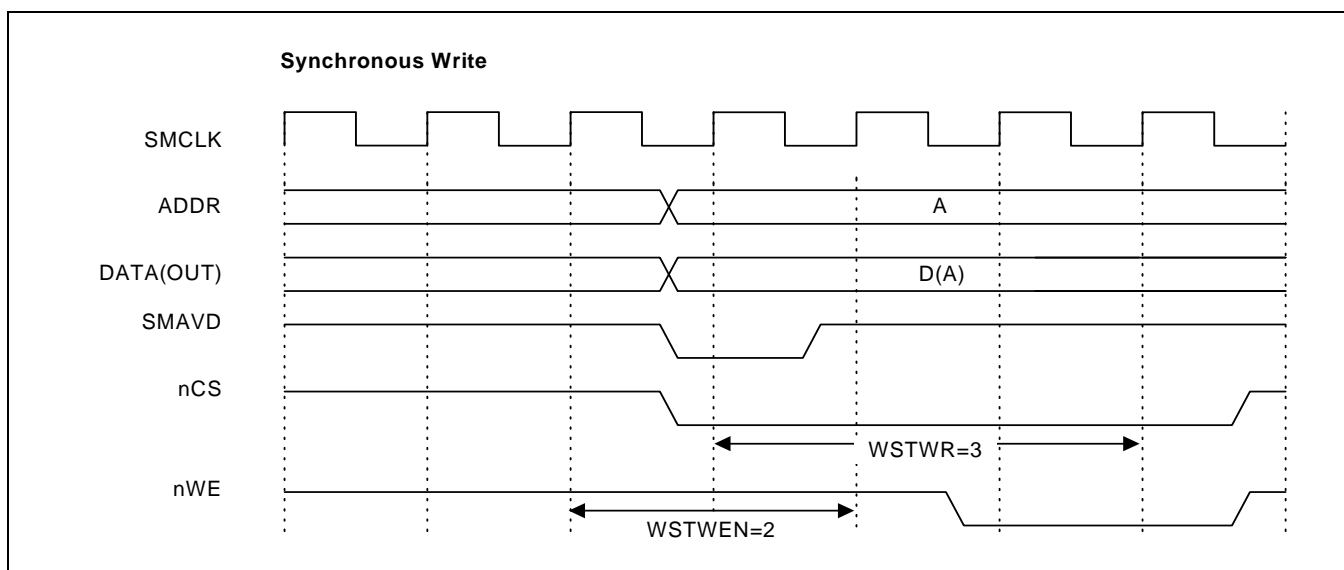

Figure 5-10. Synchronous Two Wait State Write

### 3.5 BUS TURNAROUND

You can configure the SMC for each memory bank to use external bus turnaround cycles between read and write memory accesses. You can program the IDCY field for up to 15 bus turnaround wait states. This avoids bus contention on the external memory data bus. Bus turnaround cycles are generated between external bus transfers as follows:

- read-to-read, to different memory banks
- read-to-write to the same memory banks
- read-to-write to different memory banks

Figure 5-11 shows a zero wait asynchronous read followed by two zero wait asynchronous writes with two turnaround cycles added. The standard minimum of two AHB wait states are added to the read transfer, one is added to the first write, as for any read-write transfer sequence, and three are added to the second write because of insertion of the two turnaround cycles that are only generated after the first write transfer has been detected, and the standard one wait state added when a write transfer is buffered.

Figure 5-11. Read, then two Writes (WSTRD=WSTWR=0), Two Turnaround Cycles (IDCY=2)

### 3.5.1 Scenario Examples

ADDR<->CS: 3-cycle, CS<->OE: 4-cycle, CS<->WE: 5-cycle

3.5.2 SRAM Memory Interface Examples

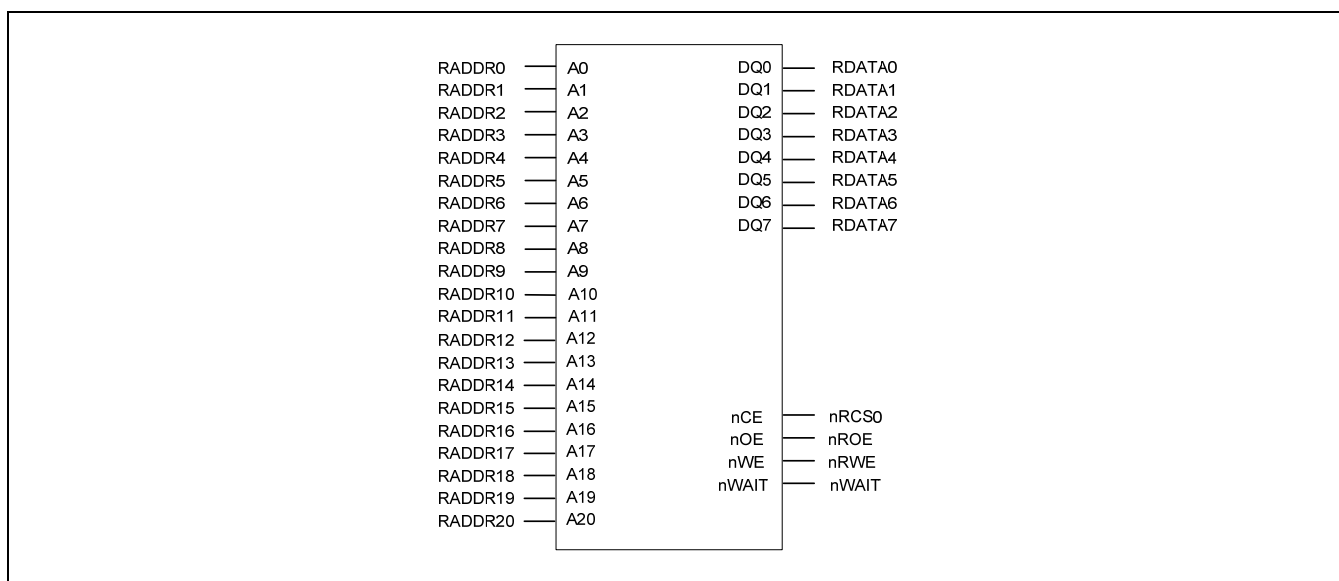

Figure 5-12. Memory Interface with 8-bit SRAM (2MB)

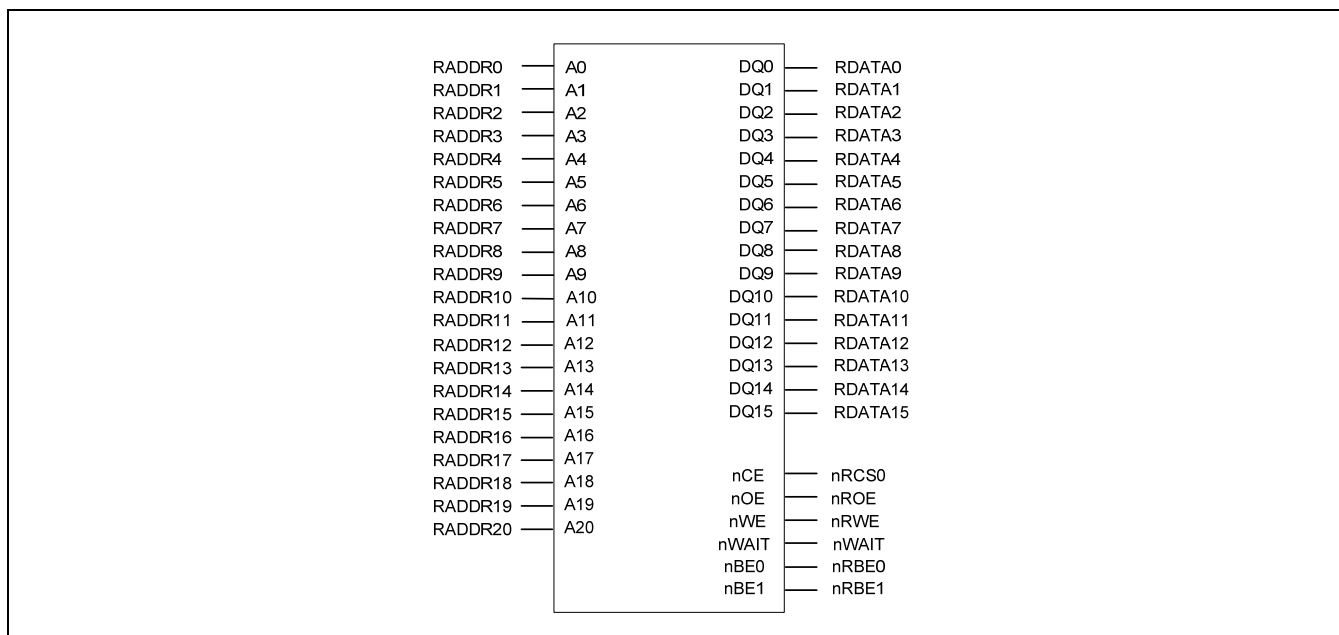

Figure 5-13. Memory Interface with 16-bit SRAM (4MB)

| Addr. connection | SRAM/ROM      |        | S3C2451 |
|------------------|---------------|--------|---------|
|                  | 8bit data bus | A0     | RADDR0  |
| 16bit data bus   | A0            | RADDR0 |         |

## 4 SPECIAL REGISTERS

### 4.1 BANK IDLE CYCLE CONTROL REGISTERS 0-5

| Register  | Address    | R/W | Description                       | Reset Value |
|-----------|------------|-----|-----------------------------------|-------------|
| SMBIDCYR0 | 0x4F000000 | R/W | Bank0 idle cycle control register | 0xF         |
| SMBIDCYR1 | 0x4F000020 | R/W | Bank1 idle cycle control register | 0xF         |
| SMBIDCYR2 | 0x4F000040 | R/W | Bank2 idle cycle control register | 0xF         |
| SMBIDCYR3 | 0x4F000060 | R/W | Bank3 idle cycle control register | 0xF         |
| SMBIDCYR4 | 0x4F000080 | R/W | Bank4 idle cycle control register | 0xF         |
| SMBIDCYR5 | 0x4F0000A0 | R/W | Bank5 idle cycle control register | 0xF         |

|      | Bit    | Description   | Initial State |
|------|--------|---|---------------|
|      | [31:4] | Read undefined. Write as zero.  | 0x0           |
| IDCY | [3:0]  | Idle or turnaround cycles. Default to 1111 at reset.<br>This field controls the number of bus turnaround cycles added between read and write accesses to prevent bus contention on the external memory data bus.<br>Turnaround time = IDCY x SMCLK period | 0xF           |

### 4.2 BANK READ WAIT STATE CONTROL REGISTERS 0-5

| Register   | Address    | R/W | Description                            | Reset Value |
|------------|------------|-----|--|-------------|
| SMBWSTRDR0 | 0x4F000004 | R/W | Bank0 read wait state control register | 0x1F        |
| SMBWSTRDR1 | 0x4F000024 | R/W | Bank1 read wait state control register | 0x1F        |
| SMBWSTRDR2 | 0x4F000044 | R/W | Bank2 read wait state control register | 0x1F        |
| SMBWSTRDR3 | 0x4F000064 | R/W | Bank3 read wait state control register | 0x1F        |
| SMBWSTRDR4 | 0x4F000084 | R/W | Bank4 read wait state control register | 0x1F        |
| SMBWSTRDR5 | 0x4F0000A4 | R/W | Bank5 read wait state control register | 0x1F        |

|       | Bit    | Description  | Initial State |
|-------|--------|--|---------------|
|       | [31:5] | Read undefined. Write as zero.   | 0x0           |
| WSTRD | [4:0]  | Read wait state. Defaults to 11111 at reset.<br>For SRAM and ROM, the wSTRD field controls the number of wait states for read accesses, and the external wait assertion timing for reads.<br>For burst ROM, the WSTRD field controls the number of wait states for the first read access only.<br>Wait state time = WSTRD x SMCLK period | 0x1F          |

4.3 BANK WRITE WAIT STATE CONTROL REGISTERS 0-5

| Register   | Address    | R/W | Description                             | Reset Value |
|------------|------------|-----|---|-------------|
| SMBWSTWRR0 | 0x4F000008 | R/W | Bank0 write wait state control register | 0x1F        |
| SMBWSTWRR1 | 0x4F000028 | R/W | Bank1 write wait state control register | 0x1F        |
| SMBWSTWRR2 | 0x4F000048 | R/W | Bank2 write wait state control register | 0x1F        |
| SMBWSTWRR3 | 0x4F000068 | R/W | Bank3 write wait state control register | 0x1F        |
| SMBWSTWRR4 | 0x4F000088 | R/W | Bank4 write wait state control register | 0x1F        |
| SMBWSTWRR5 | 0x4F0000A8 | R/W | Bank5 write wait state control register | 0x1F        |

|       | Bit    | Description   | Initial State |
|-------|--------|---|---------------|
|       | [31:5] | Read undefined. Write as zero.  | 0x0           |
| WSTWR | [4:0]  | Write wait state. Defaults to 11111 at reset.<br>For SRAM , the WSTWR field controls the number of wait states for write accesses, and the external wait assertion timing for writes.<br>Wait state time = WSTWR x SMCLK period<br>WSTWR does not apply to read-only devices such as ROM. | 0x1F          |

4.4 BANK OUTPUT ENABLE ASSERTION DELAY CONTROL REGISTERS 0-5

| Register    | Address    | R/W | Description  | Reset Value |
|-------------|------------|-----|--|-------------|
| SMBWSTOENR0 | 0x4F00000C | R/W | Bank0 output enable assertion delay control register | 0x2         |
| SMBWSTOENR1 | 0x4F00002C | R/W | Bank1 output enable assertion delay control register | 0x2         |
| SMBWSTOENR2 | 0x4F00004C | R/W | Bank2 output enable assertion delay control register | 0x2         |
| SMBWSTOENR3 | 0x4F00006C | R/W | Bank3 output enable assertion delay control register | 0x2         |
| SMBWSTOENR4 | 0x4F00008C | R/W | Bank4 output enable assertion delay control register | 0x2         |
| SMBWSTOENR5 | 0x4F0000AC | R/W | Bank5 output enable assertion delay control register | 0x2         |

|        | Bit    | Description  | Initial State |
|--------|--------|--|---------------|
|        | [31:4] | Read undefined. Write as zero.   | 0x0           |
| WSTOEN | [3:0]  | Output enable assertion delay from chip select assertion.<br>Default to 0x2 at reset | 0x2           |

**NOTE:** If you would use a muxed OneNAND, the register value of WSTOEN should be larger than 2.

## 4.5 BANK WRITE ENABLE ASSERTION DELAY CONTROL REGISTERS 0-5

| Register    | Address    | R/W | Description   | Reset Value |
|-------------|------------|-----|---|-------------|
| SMBWSTWENR0 | 0x4F000010 | R/W | Bank0 write enable assertion delay control register | 0x2         |
| SMBWSTWENR1 | 0x4F000030 | R/W | Bank1 write enable assertion delay control register | 0x2         |
| SMBWSTWENR2 | 0x4F000050 | R/W | Bank2 write enable assertion delay control register | 0x2         |
| SMBWSTWENR3 | 0x4F000070 | R/W | Bank3 write enable assertion delay control register | 0x2         |
| SMBWSTWENR4 | 0x4F000090 | R/W | Bank4 write enable assertion delay control register | 0x2         |
| SMBWSTWENR5 | 0x4F0000B0 | R/W | Bank5 write enable assertion delay control register | 0x2         |

|        | Bit    | Description  | Initial State |
|--------|--------|--|---------------|
|        | [31:4] | Read undefined. Write as zero.   | 0x0           |
| WSTWEN | [3:0]  | Write enable assertion delay from chip select assertion. Default to 0x2 at reset | 0x2           |

**NOTE:** SMBWSTRDRx, SMBWSTWRRx, SMBWSTOENRx and SMBWSTWENRx registers are applied when nWAIT signal is not used (WaitEn bit in SMBCRx is set to '0'). Otherwise, DRnOWE and DRnCS bits in SMBCRx register are applied when nWAIT signal is used (WaitEn bit in SMBCRx is set to '1').

4.6 BANK CONTROL REGISTERS 0-5

| Register | Address    | R/W | Description            | Reset Value       |
|----------|------------|-----|------------------------|-------------------|
| SMBCR0   | 0x4F000014 | R/W | Bank0 control register | See note in p5-17 |
| SMBCR1   | 0x4F000034 | R/W | Bank1 control register | 0x303000          |
| SMBCR2   | 0x4F000054 | R/W | Bank2 control register | 0x303010          |
| SMBCR3   | 0x4F000074 | R/W | Bank3 control register | 0x303000          |
| SMBCR4   | 0x4F000094 | R/W | Bank4 control register | 0x303010          |
| SMBCR5   | 0x4F0000B4 | R/W | Bank5 control register | 0x303010          |

|                   | Bit     | Description   | Initial State |
|-------------------|---------|---|---------------|
|                   | [31:26] | Read undefined. Write as zero.  | 0x0           |
| DELAYnCS          | [25:22] | Controls the delay between ADDR signal and nCS signal. The field is valid only when DRnCS bit is 1.   | 0x0           |
|                   | [21]    | not available(should be high)   | 0x1           |
| AddrValid WriteEn | [20]    | Controls the behavior of the signal RSMAMD during write operations:<br>0 = Signal always HIGH<br>1 = Signal active for asynchronous and synchronous write accesses (default).   | 0x1           |
| BurstLenWrite     | [19:18] | Burst transfer length. Sets the number of sequential transfers that the burst device supports for a write:<br>00 = 4-transfer burst (default)<br>01 = Reserved<br>10 = Reserved<br>11 = Reserved  | 0x0           |
| SyncWriteDev      | [17]    | 0 = Asynchronous device (default).<br>1 = Synchronous device.   | 0x0           |
| BMWrite           | [16]    | Burst mode write:<br>0 = Nonburst writes to memory devices (default at reset)<br>1 = Burst mode writes to memory devices.   | 0x0           |
| DRnOWE            | [15]    | 0 = No delay (default)<br>1 = Get the delay between nCS signal and nOE/nWE signal.<br>nOE: The number of cycle is defined by SMBWSTOENRx which must be larger than 1.<br>nWE: The number of cycle is defined by SMBWSTWENRx which must be larger than 1.<br>This bit is applied only when nWAIT signal is used. | 0x0           |
| Reserved          | [14]    | Reserved  | 0x0           |
| Reserved          | [13]    | not available(should be high)   | 0x1           |
| AddrValid ReadEn  | [12]    | Controls the behavior of the signal RSMAMD during read operations:<br>0 = Signal always HIGH.<br>1 = Signal active for asynchronous and synchronous read accesses (default).  | 0x1           |

|                  | Bit     | Description   | Initial State     |
|------------------|---------|---|-------------------|
| BurstLen<br>Read | [11:10] | Burst transfer length. Sets the number of sequential transfers that the burst device supports for a read:<br>00 = 4-transfer burst. 01 = 8-transfer burst.<br>10 = 16-transfer burst. 11 = Reserved   | 0x0               |
| SyncReadDev      | [9]     | Synchronous access capable device connected. Access the device using synchronous accesses for reads:<br>0 = Asynchronous device (default).<br>1 = Synchronous device.   | 0x0               |
| BMRead           | [8]     | Burst mode read and asynchronous page mode:<br>0 = Nonburst reads from memory devices (default at reset).<br>1 = Burst mode reads from memory devices.  | 0x0               |
| DRnCS            | [7]     | 0 = No delay (default)<br>1 = Get the delay between ADDR signal and nCS signal.<br>The number of cycle is defined by DELAYnCS field of SMBCRx.<br>This bit is applied only when nWAIT signal is used.   | 0x0               |
| SMBLSPOL         | [6]     | Polarity of signal nBE:<br>0 = Signal is active LOW (default).<br>1 = Signal is active HIGH.  | 0x0               |
| MW               | [5:4]   | Memory width:<br>00 = 8-bit. 01 = 16-bit.<br>10 = Reserved. 11 = Reserved.<br>Defaults to different values at reset for each bank.<br>For SMBCR0, reset value is set according to OM. (See table 1-4)   | See note in p5-17 |
| Reserved         | [3]     | Reserved  | 0x0               |
| WaitEn           | [2]     | External memory controller wait signal enable:<br>0 = The SMC is not controlled by the external wait signal (default at reset).<br>1 = The SMC looks for the external wait input signal, nWAIT.   | 0x0               |
| WaitPol          | [1]     | Polarity of the external wait input for activation:<br>0 = The nWAIT signal is active LOW (default at reset).<br>1 = The nWAIT signal is active HIGH.   | 0x0               |
| RBLE             | [0]     | Read byte lane enable:<br>0 = nBE[1:0] all deasserted HIGH during system reads from external memory. This is for 8-bit devices where the byte lane enable is connected to the write enable pin so you must deassert it during a read (default at reset). The nBE signals act as write enables in this configuration.<br>1 = nBE[1:0] all asserted LOW during system reads from external memory. This is for 16 or 32-bit devices where you use the separate write enable signal, and you must hold the byte lane selects asserted during a read. The nBE signal acts as the write enable in this configuration. | 0x0               |

**NOTE:** Initial value of SMBCR0 is 0x303010 or 0x303000 according to OM value(See table 1-4), because the memory width, MW, of the booting memory is determined by OM.

**4.7 BANK ONENAND TYPE SELECTION REGISTER**

| Register    | Address    | R/W | Description                              | Reset Value |
|-------------|------------|-----|--|-------------|
| SMBONETYPER | 0x4F000100 | R/W | SMC Bank OneNAND type selection register | 0x0         |

|           | Bit    | Description                              | Initial State |
|-----------|--------|--|---------------|
|           | [31:6] | Read undefined.                          | 0x0           |
| BANK5TYPE | [5]    | 0 = DEMUXED OneNAND<br>1 = MUXED OneNAND | 0x0           |
| BANK4TYPE | [4]    | 0 = DEMUXED OneNAND<br>1 = MUXED OneNAND | 0x0           |
| BANK3TYPE | [3]    | 0 = DEMUXED OneNAND<br>1 = MUXED OneNAND | 0x0           |
| BANK2TYPE | [2]    | 0 = DEMUXED OneNAND<br>1 = MUXED OneNAND | 0x0           |
| BANK1TYPE | [1]    | 0 = DEMUXED OneNAND<br>1 = MUXED OneNAND | 0x0           |
|           | [0]    | Reserved                                 | 0x0           |

**NOTE:** Type of bank0 OneNAND is determined by OM[4:2] signals (See table 1-4).

**4.8 SMC STATUS REGISTER**

| Register | Address    | R/W | Description         | Reset Value |
|----------|------------|-----|---------------------|-------------|
| SMCSR    | 0x4F000200 | R   | SMC status register | 0x0         |

|            | Bit    | Description  | Initial State |
|------------|--------|--|---------------|
|            | [31:1] | Read undefined.  | 0x0           |
| WaitStatus | [0]    | External wait status, read:<br>0 = nWAIT deasserted.<br>1 = nWAIT asserted.<br><br>After an externally waited transfer that was terminated early, this bit value can detect when nWAIT is deasserted. At all other times, this bit reads zero. | 0x0           |

## 4.9 SMC CONTROL REGISTER

| Register | Address    | R/W | Description          | Reset Value |
|----------|------------|-----|----------------------|-------------|
| SMCCR    | 0x4F000204 | R/W | SMC control register | 0x3         |

|             | Bit    | Description  | Initial State |
|-------------|--------|--|---------------|
|             | [31:2] | Read undefined. Write as zero.   | 0x0           |
| MemClkRatio | [1]    | Defines the ratio of SMCLK to HCLK:<br>0 = SMCLK = HCLK.<br>1 = SMCLK = HCLK/2.  | 0x1           |
| SMClockEn   | [0]    | SMCLK enable:<br>0 = Clock only active during memory accesses.<br>1 = Clock always running.<br><br>Clock stopping saves power by stopping SMCLK when it is not required. If clock stopping is enabled before the memory access, the SMC stops SMCLK on the following conditions: <ul style="list-style-type: none"> <li>• asynchronous read access to asynchronous memory</li> <li>• asynchronous write access to asynchronous memory</li> <li>• asynchronous read access to synchronous memory</li> <li>• asynchronous write access to synchronous memory.</li> </ul> | 0x1           |

NOTES

# 6

## MOBILE DRAM CONTROLLER

### 1 OVERVIEW

The S3C2451 Mobile DRAM Controller supports three kinds of memory interface - (Mobile) SDRAM and mobile DDR and DDR2. Mobile DRAM controller provides 2 chip select signals (2 memory banks), these are used for up to 2 (mobile) SDRAM banks or 2 mobile DDR banks or 2 DDR2 banks. Mobile DRAM controller can't support 3 kinds of memory interface simultaneous, for example one bank for (mobile) SDRAM and one bank for mobile DDR.

Mobile DRAM controller has the following features:

- Support little endian
- Mobile DDR SDRAM and (Mobile) SDRAM
  - Supports 32-bit for SDRAM and 16-bit data bus interface for mDDR and DDR2.
  - Address space: up to 128Mbyte
  - Supports 2 banks: 2-nCS (chip selection)
  - 16-bit Refresh Timer
  - Self Refresh Mode support (controlled by power management)
  - Programmable CAS Latency
  - Provide Write buffer: 8-word size
  - Provide pre-charge and active power down mode
  - Provide power save mode
  - Support extended MRS for mobile DRAM)
    - ◆ DS, TSCR, PASR
- DDR2 Features
  - Support DDR2 having 4-bank architecture, don't support 8-bank architecture.
  - Support 16-bit external data bus interface
  - Support AL(Additive Latency) 0, don't support posted CAS, it needs EMRS setting.
  - Don't support ODT and nDQS function, it needs EMRS setting.
  - All other features are same to the features of SDR/mDDR

## 2 BLOCK DIAGRAM

Figure 6-1 shows the block diagram of Mobile DRAM Controller

Figure 6-1. Mobile DRAM Controller Block Diagram

### 3 MOBILE DRAM INITIALIZATION SEQUENCE

On power-on reset, software must initialize the memory controller and the mobile DRAM connected to the controller. Refer to the mobile DRAM(SDRAM or mDDR or DDR2) data sheet for the start up procedure, and example sequences are given below:

#### 3.1 MOBILE DRAM(SDRAM OR MOBILE DDR) INITIALIZATION SEQUENCE

1. Wait 200us to allow DRAM power and clock stabilize.
2. Setting the Configuration Register0. This is for MRS and EMRS command to DRAM.
3. Program the configuration register1, and 3 to their normal operation values
4. Program the INIT[1:0] to '01b'. This automatically issues a PALL(pre-charge all) cammand to the DRAM.
5. Write '0xff' into the refresh timer register. This provides a refresh cycle every 255-clock cycles.
6. Wait minimum 2 auto-refresh cycle; DRAM requires minimun 2 auto-refresh cycle.
7. Program the INIT[1:0] of Control Register1 to '10b'. This automatically issues a MRS command to the DRAM
8. Program the normal operational value(auto-refresh ducy cycle) into the refresh timer.
9. Program the INIT[1:0] of Control Register1 to '11b'. This automatically issues a EMRS command to the Mobile DRAM, It's only needed for Mobile DRAM.
10. Program the INIT[1:0] to '00b'. The controller enters the normal mode.
11. The external DRAM is now ready for normal operation.

#### 3.2 DDR2 INITIALIZATION SEQUENCE

1. Setting the BANKCFG & BANKCON1, 2, 3
2. Wait 200us to allow DRAM power and clock stabilize.
3. Wait minimum of 400 ns then issue a PALL(pre-charge all) command.  
Program the INIT[1:0] to '01b'. This automatically issues a PALL(pre-charge all) cammand to the DRAM.
4. Issue an EMRS command to EMR(2), provide LOW to BA0, High to BA1.  
Program the INIT[1:0] of Control Register1 to '11b' & BANKCON3[31]='1b'
5. Issue an EMRS command to EMR(3), provide High to BA0 and BA1.  
Program the INIT[1:0] of Control Register1 to '11b' & BANKCON3[31:30]='11b'
6. Issue an EMRS to enable DLL and RDQS, nDQS, ODT disable.
7. Issue a Mode Register Set command for DLL reset.(To issue DLL Reset command, provide HIGH to A8 and LOW to BA0-BA1, and A13-A15.) Program the INIT[1:0] to '10b'. & BANKCON3[8]='1b'
8. Issue a PALL(pre-charge all) command.  
Program the INIT[1:0] to '01b'. This automatically issues a PALL(pre-charge all) cammand to the DRAM.
9. Issue 2 or more auto-refresh commands.
10. Issue a MRS command with LOW to A8 to initialize device operation.  
Program the INIT[1:0] to '10b'. & BANKCON3[8]='0b'
11. Wait 200 clock after step 7, execute OCD Calibration.
12. The external DRAM is now ready for normal operation

3.2.1 (Mobile) SDRAM Memory Interface Examples

Figure 6-2. Memory Interface with 16-bit SDRAM (4Mx16, 4banks)

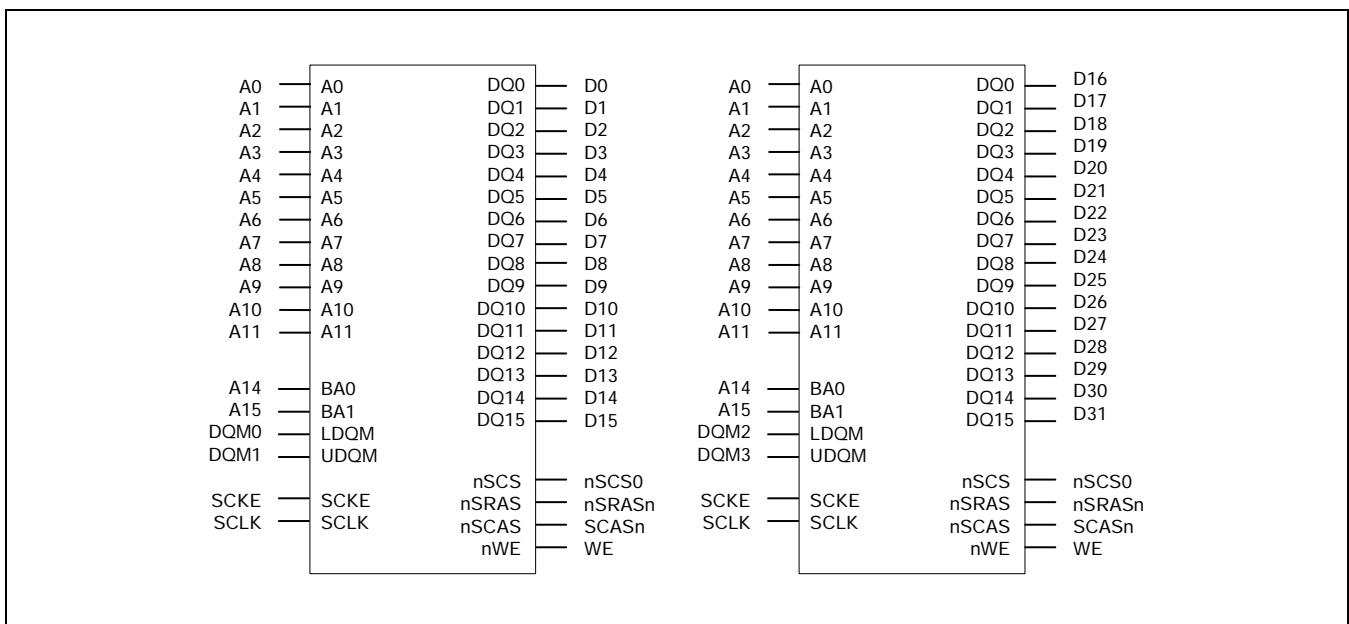

Figure 6-3. Memory Interface with 32-bit SDRAM (4Mx16 \* 2ea, 4banks)

3.2.2 Mobile DDR (and DDR2) Memory Interface Examples

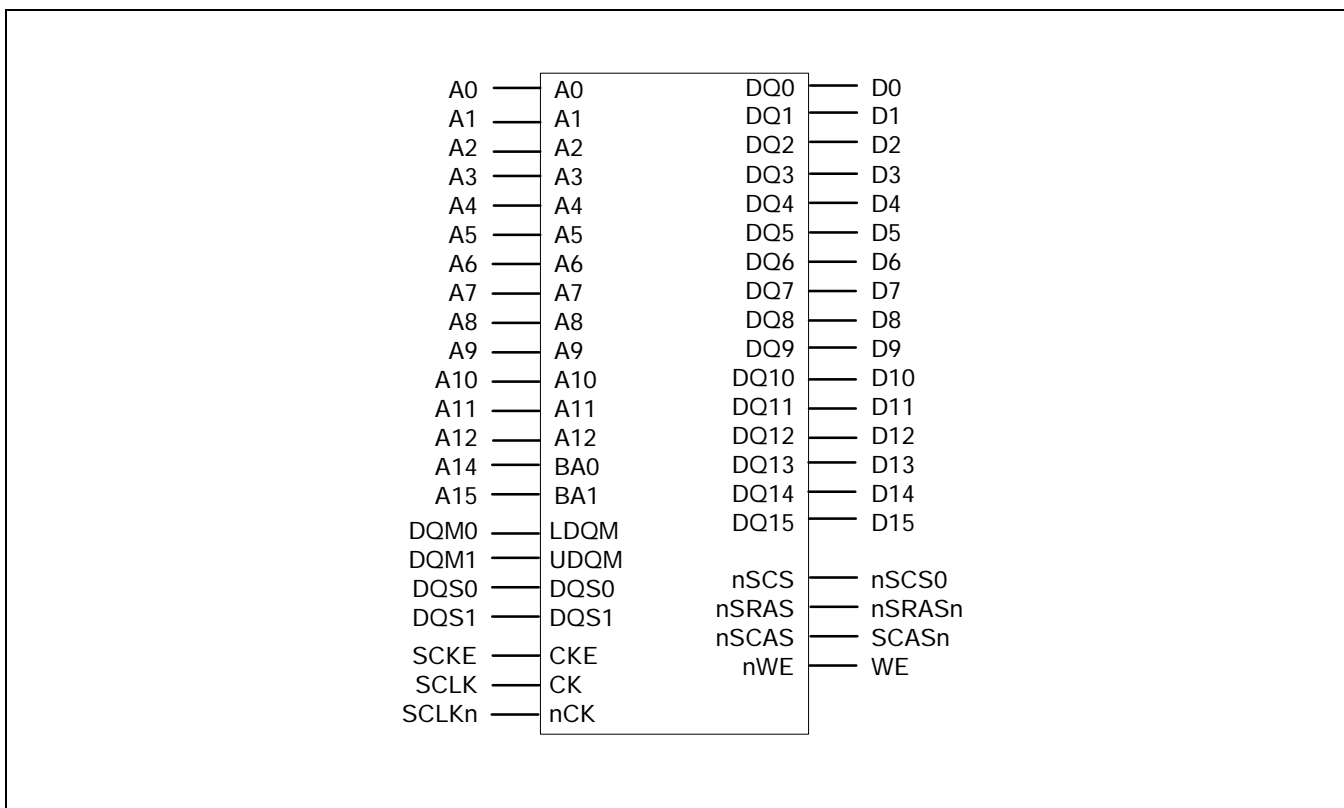

Figure 6-4. Memory Interface with 16-bit Mobile DDR and DDR2

3.2.3 Supported Programmable Timing Parameters

Figure 6-5. DRAM Timing Diagram

Figure 6-5 shows a timing diagram of DRAM. There are many timing parameters provided by DRAM. And DRAMC only provides some timing parameters to support various DRAM memories, like SDR, mobile DDR and DDR2.

tARFC and tRP are programmable, so you can also control the tRAS period by using these parameters. And the delay from RAS to CAS is determined by tRCD. And CL(CAS Latency) is also programmable. The timing diagram of CL (CAS Latency) is like Figure 6-6.

Figure 6-6. CL (CAS Latency) Timing Diagram

DRAMC also needs tARFC timing parameter to control of the timing for auto-refresh to CMD and self-refresh to CMD period. The Figure 6-7 shows the tARFC timing diagram.

Figure 6-7. tARFC Timing Diagram

## 3.3 MOBILE DRAM CONFIGURATION REGISTER

| Register | Address    | R/W | Description                        | Reset Value |
|----------|------------|-----|------------------------------------|-------------|
| BANKCFG  | 0x48000000 | R/W | Mobile DRAM configuration register | 0x0000_000C |

| BANKCFG  | Bit     | Description   | Initial State |
|----------|---------|---|---------------|
| Reserved | [31:19] | Reserved  | 0x0000        |

| <b>PnBANKCON</b> | <b>Bit</b> | <b>Description</b>    | <b>Initial State</b> |
|------------------|------------|-----------------------|----------------------|
| BA               | [31:30]    | Bank address for EMRS | 10b                  |
| Reserved         | [29:16]    | Should be '0'         | 0x0                  |

### 3.7 MOBILE DRAM REFRESH CONTROL REGISTER

| Register | Address    | R/W | Description                          | Reset Value |
|----------|------------|-----|--------------------------------------|-------------|
| REFRESH  | 0x48000010 | R/W | Mobile DRAM refresh control register | 0x0000_0020 |

| REFRESH  | Bit     | Description  | Initial State |
|----------|---------|--|---------------|
| Reserved | [31:16] | Reserved   | 0x0000        |
| REFCYC   | [15:0]  | DRAM refresh cycle.<br><b>Example:</b> Refresh period is 15.6us, and HCLK is 66MHz. The value of REFCYC is as follows:<br>$\text{REFCYC} = 15.6 \times 10^{-6} \times 66 \times 10^6 = 1029$ | 0x0020        |

### 3.8 MOBILE DRAM WRITE BUFFER TIME OUT REGISTER

A write to an enabling write buffer loads the value in the timeout register into timeout down counter of the buffer. When the timeout counter reached 0 the contents of write buffer is flushed to the external DRAM. The down counter is clocked HCLK. Writing a value of 0 in the TIMEOUT register disables the write buffer timeout function.

| Register | Address    | R/W | Description                            | Reset Value |
|----------|------------|-----|--|-------------|
| TIMEOUT  | 0x48000014 | R/W | Write Buffer Time out control register | 0x0000_0000 |

| TIMEOUT  | Bit     | Description                      | Initial State |
|----------|---------|----------------------------------|---------------|
| Reserved | [31:16] | Reserved                         | 0x0000        |
| TIMEOUT  | [15:0]  | Write buffer time-out delay time | 0x0000        |

# 7 NAND FLASH CONTROLLER

## 1 OVERVIEW

S3C2451 boot code can be executed on an external NAND flash memory. The S3C2451 is equipped with an internal SRAM buffer called 'Steppingstone'. This supports NAND flash boot loader. When you use IROM boot and select nand flash as boot device, first 8 KB of the NAND flash memory will be loaded in the Steppingstone by IROM and the boot code will be executed in the steppingstone.

Generally, In IROM boot, the boot code will copy NAND flash content to SDRAM. At that time IROM uses 8Bit ECC and the NAND flash data will be checked valid or not. After the NAND flash content is copied to SDRAM, main program will be executed on SDRAM.

To use NAND Flash Device, The OM and the GPC5/6/7 configuration should be set to use IROM boot and select proper nand device type. Nand Boot written below is boot device in IROM boot. Refer to IROM application Note for more information. S3C2451 supports nand boot by using IROM boot mode.

## 2 FEATURES

NAND flash controller features include:

1. Auto boot by: The boot code is transferred into 8-KB Steppingstone after reset. After the boot code is transferred, boot code will be executed on the Steppingstone.  
**Note:** IROM boot support 8Bit ECC correction on Nand device booting
2. NAND Flash memory I/F: Support 512Bytes, 2KB and 4KB Page.
3. Software mode: User can directly access NAND flash memory. *for example this feature can be used in read/erase/program NAND flash memory.*
4. Interface: 8-bit NAND flash memory interface bus.
5. Hardware ECC generation, detection and indication (Software correction).
6. Support both SLC and MLC NAND flash memory: 1-bit ECC, 4-bit and 8-bit ECC for NAND flash.
7. SFR I/F: Support Byte/half word/word access to Data and ECC Data register, and Word access to other registers
8. SteppingStone I/F: Support Byte/half word/word access.
9. The Steppingstone 64-KB internal SRAM buffer can be used for another purpose after NAND flash booting.

### 3 BLOCK DIAGRAM

Figure 7-1. NAND Flash Controller Block Diagram

### 4 BOOT LOADER FUNCTION

Figure 7-2. NAND Flash Controller Boot Loader Block Diagram

During reset, the IROM gets the information about the adopted NAND flash memory by using the pin status of GPC5/6/7 (refer to **Pin Configuration**). In case of POR(Power-On-Reset) or system reset, the IROM automatically loads the 8-KB boot-loader codes into the steppingstone(0x40000000). After finishing the migration of the boot-loader codes, the codes in steppingstone will be executed.

**NOTE**

In case of IROM boot mode, the ECC-checking for boot-loader code will be done. Therefore, 0 block of NAND flash should be valid block by 8Bit ECC.

### 5 GPC5/6/7 PIN CONFIGURATION TABLE IN IROM BOOT MODE

|                     | Page | Address Cycle | GPC7 [2] | GPC6 [1] | GPC5 [0] |
|---------------------|------|---------------|----------|----------|----------|
| MMC(MoviNAND/iNand) | -    | -             | 0        | 0        | 0        |
| Reserved            | -    | -             | 0        | 0        | 1        |
| Nand                | 512  | 3             | 0        | 1        | 0        |
|                     |      | 4             | 0        | 1        | 1        |
|                     | 2048 | 4             | 1        | 0        | 0        |
|                     |      | 5             | 1        | 0        | 1        |
|                     | 4096 | 5             | 1        | 1        | 0        |

Above configuration is applicable when NAND Flash is used as booting memory in IROM boot mode. If NAND Flash is not used as boot memory, the configuration can be changed by setting NFCON SFR 'NFCONF' (0x4E000000). PageSize, PageSize\_Ext and AddrCycle are fields in NFCONF(0x4E000000).

### 6 NAND FLASH MEMORY TIMING

Figure 7-3. CLE & ALE Timing (TACLS=1, TWRPH0=0, TWRPH1=0) Block Diagram

Figure 7-4. nWE & nRE Timing (TWRPH0=0, TWRPH1=0) Block Diagram

## 7 NAND FLASH ACCESS

S3C2451 does not support NAND flash access mechanism directly. It only supports signal control mechanism for NAND flash access. Therefore software is responsible for accessing NAND flash memory correctly.

1. Writing to the command register (NFCMMD) = the NAND Flash Memory command cycle
2. Writing to the address register (NFADDR) = the NAND Flash Memory address cycle
3. Writing to the data register (NFDATA) = write data to the NAND Flash Memory (write cycle)
4. Reading from the data register (NFDATA) = read data from the NAND Flash Memory (read cycle)
5. Reading main ECC registers and Spare ECC registers (NFMECCD0/1, NFSECCD) = read data from the NAND Flash Memory

### NOTE

In NAND flash access, you must check the RnB status input pin by polling the signal or using interrupt.

## 8 DATA REGISTER CONFIGURATION

### 8.1.1 8-bit NAND Flash Memory Interface

#### A. Word Access

| Register | Bit [31:24]               | Bit [23:16]               | Bit [15:8]                | Bit [7:0]                 |
|----------|---------------------------|---------------------------|---------------------------|---------------------------|
| NFDATA   | 4 <sup>th</sup> I/O[ 7:0] | 3 <sup>rd</sup> I/O[ 7:0] | 2 <sup>nd</sup> I/O[ 7:0] | 1 <sup>st</sup> I/O[ 7:0] |

#### B. Half-word Access

| Register | Bit [31:24]   | Bit [23:16]   | Bit [15:8]                | Bit [7:0]                 |
|----------|---------------|---------------|---------------------------|---------------------------|
| NFDATA   | Invalid value | Invalid value | 2 <sup>nd</sup> I/O[ 7:0] | 1 <sup>st</sup> I/O[ 7:0] |

#### C. Byte Access

| Register | Bit [31:24]   | Bit [23:16]   | Bit [15:8]    | Bit [7:0]                 |
|----------|---------------|---------------|---------------|---------------------------|
| NFDATA   | Invalid value | Invalid value | Invalid value | 1 <sup>st</sup> I/O[ 7:0] |

## 9 STEPPINGSTONE (8KB IN 64KB SRAM)

The NAND Flash controller uses Steppingstone as the buffer on booting and also you can use this area for various other purpose.

## 10 1BIT / 4BIT / 8BIT ECC (ERROR CORRECTION CODE)

NAND flash controller has four ECC (Error Correction Code) modules for 1 bit ECC, one for 4bit ECC and one for 8bit ECC.

The 1bit ECC modules for main data area can be used for (up to) 2048 bytes ECC parity code generation, and 1 bit ECC module for spare area can be used for (up to) 4 bytes ECC Parity code generation.

Both 4bit and 8bit ECC modules can be used for only 512 bytes ECC parity code generation.

4 bit and 8bit ECC modules generate the parity codes for each 512 byte. However, 1 bit ECC modules generate parity code per byte lane separately.

### 10.1 ECC MODULE FEATURES

ECC generation is controlled by the ECC Lock (MainECCLock, SpareECCLock) bit of the Control register. When ECCLock is Low, ECC codes are generated by the H/W ECC modules.

### 10.1.1 1-BIT ECC Register Configuration

Following tables shows the configuration of 1-bit ECC value read from spare area of external NAND flash memory. For comparing to ECC parity code generated by the H/W modules, each ECC data read from memory must be written to NFMECCDn for main area and NFSECCD for spare area.

#### NOTE

4-bit ECC decoding scheme is different to 1-bit ECC.

#### 1. NAND Flash Memory Interface

| Register | Bit [31:24] | Bit [23:16]                      | Bit [15:8] | Bit [7:0]                        |
|----------|-------------|----------------------------------|------------|----------------------------------|
| NFMECCD0 | Not used    | 2 <sup>nd</sup> ECC for I/O[7:0] | Not used   | 1 <sup>st</sup> ECC for I/O[7:0] |
| NFMECCD1 | Not used    | 4 <sup>th</sup> ECC for I/O[7:0] | Not used   | 3 <sup>rd</sup> ECC for I/O[7:0] |

| Register | Bit [31:24] | Bit [23:16]                      | Bit [15:8] | Bit [7:0]                        |
|----------|-------------|----------------------------------|------------|----------------------------------|
| NFSECCD  | Not used    | 2 <sup>nd</sup> ECC for I/O[7:0] | Not used   | 1 <sup>st</sup> ECC for I/O[7:0] |

## 10.2 1-BIT ECC PROGRAMMING ENCODING AND DECODING

1. To use 1-bit ECC in software mode, reset the ECCType to '0' (enable 1-bit ECC). ECC module generates ECC parity code for all read / write data when MainECCLock (NFCONT[7]) and SpareECCLock (NFCONT[6]) are unlocked('0'). You must reset ECC value by writing the InitMECC (NFCONT[5]) and InitSECC (NFCONT[4]) bit as '1' and have to clear the MainECCLock (NFCONT[7]) bit to '0'(Unlock) before read or write data.  
MainECCLock (NFCONT[7]) and SpareECCLock(NFCONT[6]) bit controls whether ECC Parity code is generated or not.
2. Whenever data is read or written, the ECC module generates ECC parity code on register NFMECC0/1.
3. After you complete read or write one page (does not include spare area data), Set the MainECCLock bit to '1' (Lock). ECC Parity code is locked and the value of the ECC status register will not be changed.
4. To generate spare area ECC parity code, Clear SpareECCLock (NFCONT[6]) bit to '0' (unlock).
5. Whenever data is read or written, the spare area ECC module generates ECC parity code on register NFSECC.
6. After you complete read or write spare area, set the SpareECCLock bit to '1' (Lock). ECC Parity code is locked and the value of the ECC status register will not be changed.
7. From now on, you can use these values to record to the spare area or check the bit error.
8. For example, to check the bit error of main data area on page read operation, after generating of ECC codes for main data area, you have to move the ECC parity codes (is stored to spare area) to NFMECCD0 and NFMECCD1. From this time, the NFSECCERR0 have the valid error status values.

### NOTE

NFSECCD is for the ECC value in spare area. Usually, the user will write the ECC value generated from main data area to Spare area, which value will be the same as NFMECC0/1.

## 10.3 4-BIT ECC PROGRAMMING GUIDE (ENCODING)

1. To use 4-bit ECC in software mode, set the MsgLength to 0(512-byte message length) and set the ECCType to '1'(enable 4-bit ECC). ECC module generates ECC parity code for 512-byte write data. So, you have to reset ECC value by writing the InitMECC (NFCONT[5]) bit as '1' and have to clear the MainECCLock (NFCONT[7]) bit to '0'(Unlock) before write data.  
MainECCLock (NFCONT[7]) bit controls whether ECC Parity code is generated or not.
2. Whenever data is written, the 4-bit ECC module generates ECC parity code internally.
3. After you finish writing 512-byte data (not include spare area data), the parity codes are automatically updated to NFMECC0, NFMECC1 register. If you use 512-byte NAND flash memory, you can program these values to spare area. However, if you use NAND flash memory more than 512-byte page, you can't program immediately. In this case, you have to copy these parity codes to other memory like DRAM. After writing all main data, you can write the copied ECC values to spare area.  
The parity codes have self-correctable information include parity code itself.
4. To generate spare area ECC parity code, set the MsgLength to 1(24-byte message length), and set the ECCType to '1'(enable 4-bit ECC). ECC module generates ECC parity code for 24-byte write data. So you have to reset ECC value by writing the InitMECC (NFCONT[5]) bit as '1' and have to clear the MainECCLock (NFCONT[7]) bit to '0'(Unlock) before write data.  
MainECCLock (NFCONT[7]) bit controls whether ECC Parity code is generated or not.
5. Whenever data is written, the 4-bit ECC module generates ECC parity code internally.
6. When you finish writing 24-byte meta or extra data, the parity codes are automatically updated to NFMECC0, NFMECC1 register. You can program these parity codes to spare area.  
The parity codes have self-correctable information include parity code itself.

#### 10.4 4-BIT ECC PROGRAMMING GUIDE (DECODING)

1. To use 4-bit ECC, set the `MsgLength` to 0(512-byte message length) and set the `ECCType` to '1'(enable 4-bit ECC). ECC module generates ECC parity code for 512-byte read data. So, you have to reset ECC value by writing the `InitMECC` (`NFCNT[5]`) bit as '1' and have to clear the `MainECCLock` (`NFCNT[7]`) bit to '0'(Unlock) before read data.  
`MainECCLock` (`NFCNT[7]`) bit controls whether ECC Parity code is generated or not.
2. Whenever data is read, the 4-bit ECC module generates ECC parity code internally.
3. After you complete read 512-byte (does not include spare area data), you have to read parity codes. 4-bit ECC module needs parity codes to detect whether error bits are or not. So you have to read ECC parity code right after read 512-byte. Once ECC parity code is read, 4-bit ECC engine start to search any error internally. 4-bit ECC error searching engine need minimum 155 cycles to find any error. During this time, you can continue read main data from external NAND flash memory. `ECCDecDone`(`NFSTAT[6]`) can be used to check whether ECC decoding is completed or not.
4. When `ECCDecDone` (`NFSTAT[6]`) is set ('1'), `NFECERR0` indicates whether error bit exist or not. If any error exists, you can fix it by referencing `NFECERR0/1` and `NFMLCBITPT` register.
5. If you have more main data to read, continue to step 2.
6. For meta data error check, set the `MsgLength` to 1(24-byte message length) and set the `ECCType` to '1'(enable 4-bit ECC). ECC module generates ECC parity code for 24-byte read data. So you have to reset ECC value by writing the `InitMECC` (`NFCNT[5]`) bit as '1' and have to clear the `MainECCLock` (`NFCNT[7]`) bit to '0'(Unlock) before read data.  
`MainECCLock` (`NFCNT[7]`) bit controls whether ECC Parity code is generated or not.
7. Whenever data is read, the 4-bit ECC module generates ECC parity code internally.
8. After you complete read 24-byte, you have to read parity codes. 4-bit ECC module needs parity codes to detect whether error bits are or not. So you have to read ECC parity codes right after read 24-byte. Once ECC parity code is read, 4-bit ECC engine start to search any error internally. 4-bit ECC error searching engine need minimum 155 cycles to find any error. During this time, you can continue read main data from external NAND flash memory. `ECCDecDone`(`NFSTAT[6]`) can be used to check whether ECC decoding is completed or not.
9. When `ECCDecDone` (`NFSTAT[6]`) is set ('1'), `NFECERR0` indicates whether error bit exist or not. If any error exists, you can fix it by referencing `NFECERR0/1` and `NFMLCBITPT` register.

#### 10.5 8-BIT ECC PROGRAMMING GUIDE (ENCODING)

1. To use 8-bit ECC in software mode, set the `MsgLength` to 0(512-byte message length) and set the `ECCType` to "01"(enable 8-bit ECC). ECC module generates ECC parity code for 512-byte write data. In order to start the ECC module, you have to write '1' on the `InitMECC` (`NFCNT[5]`) bit after cleaning the `MainECCLock` (`NFCNT[7]`) bit to '0' (Unlock).  
`MainECCLock` (`NFCNT[7]`) bit controls whether ECC Parity code is generated or not.  
**NOTE:** In 8bit ECC, `MainECCLock` should be cleared before initiating `InitMECC`.
2. Whenever data is written, the 8bit ECC module generates ECC parity code internally.
3. After you finish writing 512-byte data (not include spare area data), the parity codes are automatically updated to `NF8MECC0`, `NFMECC1`, `NF8MECC2`, `NF8MECC3` register. If you use 512-byte NAND flash memory, you can program these values directly to spare area. However, if you use NAND flash memory more than 512-byte page, you can't program immediately. In this case, you have to copy these parity codes to other memory like DRAM. After writing all main data, you can write the copied ECC values to spare area.  
 The parity codes have self-correctable information include parity code itself.

4. To generate spare area ECC parity code, set the `MsgLength` to 1(24-byte message length), and set the `ECCType` to "01"(enable 8bit ECC). 8bit ECC module generates the ECC parity code for 24-byte data. In order to initiating the module, you have to write '1' on the `InitMECC` (`NFCONT[5]`) bit after clearing the `MainECCLock` (`NFCONT[7]`) bit to '0'(Unlock).  
`MainECCLock` (`NFCONT[7]`) bit controls whether ECC Parity code is generated or not.  
**NOTE:** In 8bit ECC, `MainECCLock` should be cleared before initiating `InitMECC`.
5. Whenever data is written, the 8bit ECC module generates ECC parity code internally.
6. When you finish writing 24-byte meta or extra data, the parity codes are automatically updated to `NF8MECC0`, `NFMECC1`, `NF8MECC2`, `NF8MECC3` register. You can program these parity codes to spare area. The parity codes have self-correctable information include parity code itself.

### 10.6 8-BIT ECC PROGRAMMING GUIDE (DECODING)

1. To use 8bit ECC in software mode, set the `MsgLength` to 0(512-byte message length) and set the `ECCType` to "01"(enable 8bit ECC). 8bit ECC module generates ECC parity code for 512-byte read data. In order to initiating 8bit ECC module, you have to write '1' on the `InitMECC` (`NFCONT[5]`) bit after clearing the `MainECCLock` (`NFCONT[7]`) bit to '0'(Unlock).  
`MainECCLock` (`NFCONT[7]`) bit controls whether ECC Parity code is generated or not.  
**NOTE:** In 8bit ECC, `MainECCLock` should be cleared before `InitMECC`
2. Whenever data is read, the MLC ECC module generates ECC parity code internally.
3. After you complete the reading of 512-byte data (not including spare area data), you must set the `MainECCLock` (`NFCONT[7]`) bit to '1'(Lock) and have to read parity codes. 8bit ECC module needs parity codes to detect whether error bits exists or not. So you have to read the ECC parity code of 512-byte main data right after reading the 512-byte data. Once the ECC parity code is read, 8bit ECC engine starts searching any error internally. 8bit ECC error searching engine needs minimum 372 cycles to find any error. During this time, you can continue reading data from external NAND flash memory. `ECCDecDone(NFSTAT[6])` can be used to check whether ECC decoding is completed or not.
4. When `ECCDecDone` (`NFSTAT[6]`) is set ('1'), `NF8ECCERR0` indicates whether error bit exists or not. If any error exists, you can fix it by referencing `NF8ECCERR0/1/2` and `NFMLC8BITPT0/1` register.
5. If you have more main data to read, continue doing from step 1.
6. For meta data error check, set the `MsgLength` to 1(24-byte message length) and set the `ECCType` to "01"(enable 8bit ECC). ECC module generates the ECC parity code for 24-byte data. In order to initiating the 8bit ECC module, you have to write '1' on the `InitMECC` (`NFCONT[5]`) bit after clearing the `MainECCLock` (`NFCONT[7]`) bit to '0'(Unlock).  
`MainECCLock` (`NFCONT[7]`) bit controls whether ECC Parity code is generated or not.
7. Whenever data is read, the 8bit ECC module generates ECC parity code internally.
8. After you complete reading 24-byte, you must set the `MainECCLock` (`NFCONT[7]`) bit to '1'(Lock) and read the parity code for 24-byte data. MLC ECC module needs parity codes to detect whether error bits exists or not. So you have to read ECC parity codes right after reading 24-byte data. Once ECC parity code is read, 8bit ECC engine starts searching any error internally. 8bit ECC error searching engine needs minimum 372 cycles to find any error. During this time, you can continue reading main data from external NAND flash memory. `ECCDecDone(NFSTAT[6])` can be used to check whether ECC decoding is completed or not.
9. When `ECCDecDone` (`NFSTAT[6]`) is set ('1'), `NF8ECCERR0` indicates whether error bit exist or not. If any error exists, you can fix it by referencing `NF8ECCERR0/1/2` and `NF8MLC8BITPT` register.

### 11 MEMORY MAPPING(NAND BOOT AND OTHER BOOT)

Figure 7-5. NAND Flash Memory Mapping Block Diagram

## 12 NAND FLASH MEMORY CONFIGURATION

Figure 7-6. A 8-bit NAND Flash Memory Interface Block Diagram

**NOTE:** NAND CONTROLLER can support to control two nand flash memories .

|         | NAND CS             | Other BOOT   |
|---------|---------------------|--------------|
| nFCE    | NAND CONTROLLER CS0 | Configurable |
| nRCS[1] | NAND CONTROLLER CS1 | Configurable |

If you want NAND BOOT by IROM, nFCE must be used to boot.

## 13 NAND FLASH CONTROLLER SPECIAL REGISTERS

### 13.1 NAND FLASH CONTROLLER REGISTER MAP

| Address            | R/W | Reset value | Name         | Description  |

| NFCNF     | Bit | Description  | Initial State             |
|-----------|-----|--|---------------------------|
| AddrCycle | [1] | <p>This bit indicates the number of Address cycle of NAND Flash memory.</p> <p>When Page Size is 512 Bytes,<br/>           0 = 3 address cycle<br/>           1 = 4 address cycle</p> <p>When page size is 2K or 4K,<br/>           0 = 4 address cycle<br/>           1 = 5 address cycle</p> <p>This bit is determined by OM[1] pin on reset and wake-up time from sleep mode.</p> <p>This bit can be changed by software later.</p> | H/W Set<br>(CfgAddrCycle) |
| BusWidth  | [0] | <p>This bit indicates the I/O bus width of NAND Flash Memory.</p> <p>The value of BusWidth means the followings.<br/>           0 = 8-bit bus</p> <p>This bit has no meaning in NAND-boot by IROM, when the I/O bus width is only 8-bit. BusWidth has effects on normal access.. This bit should be 0</p>  | H/W Set<br>(CfgBusWidth)  |

## 13.3 CONTROL REGISTER

| Register | Address    | R/W | Description                 | Reset Value |
|----------|------------|-----|-----------------------------|-------------|
| NFCONT   | 0x4E000004 | R/W | NAND Flash control register | 0x000100C6  |

| NFCONT        | Bit     | Description  | Initial State |
|---------------|---------|--|---------------|
| Reserved      | [31:19] | Reserved   | 0             |
| ECC Direction | [18]    | 4-bit, 8-bit ECC encoding / decoding control<br>0 = Decoding 4-bit, 8bit ECC, It is used for page read<br>1 = Encoding 4-bit, 8-bit ECC, It is be used for page program  | 0             |
| Lock-tight    | [17]    | Lock-tight configuration<br>0 = Disable lock-tight<br>1 = Enable lock-tight,<br>Once this bit is set to 1, you cannot clear. Only reset or wake up from sleep mode can make this bit disable (cannot cleared by software).<br>When it is set to 1, the area setting in NFSBLK (0x4E000020) to NFEBLK (0x4E000024) is unlocked, and except this area, write or erase command will be invalid and only read command is valid.<br>When you try to write or erase locked area, the illegal access will be occurred (NFSTAT [5] bit will be set).<br>If the NFSBLK and NFEBLK are same, entire area will be locked. | 0             |
| Soft Lock     | [16]    | Soft Lock configuration<br>0 = Disable lock<br>1 = Enable lock<br>Soft lock area can be modified at any time by software.<br>When it is set to 1, the area setting in NFSBLK (0x4E000020) to NFEBLK (0x4E000024) is unlocked, and except this area, write or erase command will be invalid and only read command is valid.<br>When you try to write or erase locked area, the illegal access will be occurred (NFSTAT [5] bit will be set).<br>If the NFSBLK and NFEBLK are same, entire area will be locked.  | 1             |
| Reserved      | [15:13] | Reserved. Should be written to 0.  | 000           |
| EnbECCDecINT  | [12]    | 4-bit, 8-bit ECC decoding completion interrupt control<br>0 = Disable interrupt<br>1 = Enable interrupt  | 0             |
| 8bit Stop     | [11]    | 8-bit ECC encoding/decoding operation initialization   | 0             |

| NFCONT           | Bit  | Description   | Initial State |
|------------------|------|---|---------------|
| EnbIllegalAccINT | [10] | Illegal access interrupt control<br>0 = Disable interrupt<br>1 = Enable interrupt<br>Illegal access interrupt will occurs when CPU tries to program or erase locking area (the area setting in NFSBLK (0x4E000020) to NFEBLK (0x4E000024)).         | 0             |
| EnbRnBINT        | [9]  | RnB status input signal transition interrupt control<br>0 = Disable RnB interrupt<br>1 = Enable RnB interrupt   | 0             |
| RnB_TransMode    | [8]  | RnB transition detection configuration<br>0 = Detect rising edge<br>1 = Detect falling edge   | 0             |
| MainECCLock      | [7]  | Lock Main area ECC generation<br>0 = Unlock Main area ECC<br>1 = Lock Main area ECC<br>Main area ECC status register is NFMECC0/1(0x4E000034/38),   | 1             |
| SpareECCLock     | [6]  | Lock Spare area ECC generation.<br>0 = Unlock Spare ECC<br>1 = Lock Spare ECC<br>Spare area ECC status register is NFSECC(0x4E00003C),  | 1             |
| InitMECC         | [5]  | 1 = Initialize main area ECC decoder/encoder (write-only)   | 0             |
| InitSECC         | [4]  | 1 = Initialize spare area ECC decoder/encoder (write-only)  | 0             |
| Reserved         | [3]  | Reserved  | 0             |
| Reg_nCE1         | [2]  | NAND Flash Memory nRCS[1] signal control<br>0 = Force nRCS[1] to low(Enable chip select)<br>1 = Force nRCS[1] to High(Disable chip select)<br><b>Note:</b> Even Reg_nCE1 and Reg_nCE0 are set to zero simultaneously, only one of them is asserted. | 1             |
| Reg_nCE0         | [1]  | NAND Flash Memory nFCE signal control<br>0 = Force nFCE to low(Enable chip select)<br>1 = Force nFCE to High(Disable chip select)<br><b>Note:</b> During boot time, it is controlled automatically.<br>This value is only valid while MODE bit is 1 | 1             |
| MODE             | [0]  | NAND Flash controller operating mode<br>0 = NAND Flash Controller Disable (Don't work)<br>1 = NAND Flash Controller Enable  | 0             |

## 13.4 COMMAND REGISTER

| Register | Address    | R/W | Description                     | Reset Value |
|----------|------------|-----|---------------------------------|-------------|
| NFCMMD   | 0x4E000008 | R/W | NAND Flash command set register | 0x00        |

| NFCMMD   | Bit    | Description                     | Initial State |
|----------|--------|---------------------------------|---------------|
| Reserved | [31:8] | Reserved                        | 0x00          |
| NFCMMD   | [7:0]  | NAND Flash memory command value | 0x00          |

## 13.5 ADDRESS REGISTER

| Register | Address    | R/W | Description                     | Reset Value |
|----------|------------|-----|---------------------------------|-------------|
| NFADDR   | 0x4E00000C | R/W | NAND Flash address set register | 0x0000XX00  |

| REG_ADDR | Bit    | Description                     | Initial State |
|----------|--------|---------------------------------|---------------|
| Reserved | [31:8] | Reserved                        | 0x00          |
| NFADDR   | [7:0]  | NAND Flash memory address value | 0x00          |

## 13.6 DATA REGISTER

| Register | Address    | R/W | Description              | Reset Value |
|----------|------------|-----|--------------------------|-------------|
| NFDATA   | 0x4E000010 | R/W | NAND Flash data register | 0xFFFF      |

| NFDATA | Bit    | Description  | Initial State |
|--------|--------|--|---------------|
| NFDATA | [31:0] | NAND Flash read/program data value for I/O<br><b>Note:</b> Refer to <b>Data Register Configuration</b> . | 0xFFFF        |

## 13.7 MAIN DATA AREA ECC REGISTER

| Register | Address    | R/W | Description   | Reset Value |
|----------|------------|-----|---|-------------|
| NFMECCD0 | 0x4E000014 | R/W | NAND Flash ECC 1 <sup>st</sup> 2 <sup>nd</sup> register for main area data read<br><b>Note:</b> Refer to <b>ECC Module Features</b> . | 0x00000000  |
| NFMECCD1 | 0x4E000018 | R/W | NAND Flash ECC 3 <sup>rd</sup> 4 <sup>th</sup> register for main area data read<br><b>Note:</b> Refer to <b>ECC Module Features</b> . | 0x00000000  |

| NFMECCD0 | Bit     | Description       | Initial State |
|----------|---------|-------------------|---------------|
| Reserved | [31:24] | Not used          | 0x00          |
| ECCData1 | [23:16] | ECC1 for I/O[7:0] | 0x00          |
| Reserved | [15:8]  | Not used          | 0x00          |
| ECCData0 | [7:0]   | ECC0 for I/O[7:0] | 0x00          |

**NOTE:** Only word access is valid.

| NFMECCD1 | Bit     | Description       | Initial State |
|----------|---------|-------------------|---------------|
| Reserved | [31:24] | Not used          | 0x00          |
| ECCData3 | [23:16] | ECC3 for I/O[7:0] | 0x00          |
| Reserved | [15:8]  | Not used          | 0x00          |
| ECCData2 | [7:0]   | ECC2 for I/O[7:0] | 0x00          |

## 13.8 SPARE AREA ECC REGISTER

| Register | Address    | R/W | Description   | Reset Value |
|----------|------------|-----|---|-------------|
| NFSECCD  | 0x4E00001C | R/W | NAND Flash ECC(Error Correction Code) register for spare area data read | 0x00000000  |

| NFSECCD   | Bit     | Description                                  | Initial State |
|-----------|---------|--|---------------|
| Reserved  | [31:24] | Not used                                     | 0x00          |
| SECCData1 | [23:16] | 2 <sup>nd</sup> Spare area ECC for I/O[7:0]  | 0x00          |
| Reserved  | [15:8]  | Not used                                     | 0x00          |
| SECCData0 | [7:0]   | 1 <sup>st</sup> Spare area ECC for I/O[ 7:0] | 0x00          |

**NOTE:** Only word or half word access is valid.

## 13.9 PROGRAMMABLE BLOCK ADDRESS REGISTER

| Register | Address    | R/W | Description   | Reset Value |
|----------|------------|-----|---|-------------|
| NFSBLK   | 0x4E000020 | R/W | NAND Flash programmable start block address   | 0x000000    |
| NFEBLK   | 0x4E000024 | R/W | NAND Flash programmable end block address<br>Nand Flash can be programmed between start and end address.<br>When the Soft lock or Lock-tight is enabled and the Start and End address has same value, Entire area of NAND flash will be locked. | 0x000000    |

| NFSBLK     | Bit     | Description  | Initial State |
|------------|---------|--|---------------|
| Reserved   | [31:24] | Reserved   | 0x00          |
| SBLK_ADDR2 | [23:16] | The 3 <sup>rd</sup> block address of the block erase operation                               | 0x00          |
| SBLK_ADDR1 | [15:8]  | The 2 <sup>nd</sup> block address of the block erase operation                               | 0x00          |
| SBLK_ADDR0 | [7:0]   | The 1 <sup>st</sup> block address of the block erase operation<br>(Only bit [7:5] are valid) | 0x00          |

| NFEBLK     | Bit     | Description  | Initial State |
|------------|---------|--|---------------|
| Reserved   | [31:24] | Reserved   | 0x00          |
| EBLK_ADDR2 | [23:16] | The 3 <sup>rd</sup> block address of the block erase operation                               | 0x00          |
| EBLK_ADDR1 | [15:8]  | The 2 <sup>nd</sup> block address of the block erase operation                               | 0x00          |
| EBLK_ADDR0 | [7:0]   | The 1 <sup>st</sup> block address of the block erase operation<br>(Only bit [7:5] are valid) | 0x00          |

The NFSLK and NFEBLK can be changed while Soft lock bit(NFCONT[16]) is enabled. But cannot be changed when Lock-tight bit(NFCONT[17]) is set.

Figure 7-7. Softlock and Lock-tight

## 13.10 NFCON STATUS REGISTER

| Register | Address    | R/W | Description                          | Reset Value |
|----------|------------|-----|--------------------------------------|-------------|
| NFSTAT   | 0x4E000028 | R/W | NAND Flash operation status register | 0x0080001D  |

| NFSTAT                | Bit     | Description  | Initial State |
|-----------------------|---------|--|---------------|
| Reserved              | [31:24] | Read undefined   | 0x00          |
| Reserved              | [23:7]  | Reserved   | 0x00          |
| ECCDecDone            | [6]     | When 4-bit ECC or 8-bit ECC decoding is finished, this value set and issue interrupt if enabled. The NFMLCBITPT, NFMLCLO and NFMLCEL1 have valid values. To clear this, write '1'.<br>1 = 4-bit ECC or 8-bit ECC decoding is completed                       | 0             |
| IllegalAccess         | [5]     | Once Soft Lock or Lock-tight is enabled, The illegal access (program, erase) to the memory makes this bit set.<br>0 = Illegal access is not detected<br>1 = Illegal access is detected   | 0             |
| RnB_TransDetect       | [4]     | When RnB low to high transition is occurred, this value set and issue interrupt if enabled. To clear this write '1'.<br>0 = RnB transition is not detected<br>1 = RnB transition is detected<br>Transition configuration is set in RnB_TransMode(NFCONT[8]). | 1             |
| NCE[1]<br>(Read-only) | [3]     | The status of nRCS[1] output pin   | 1             |
| NCE[0]<br>(Read-only) | [2]     | The status of nFCE output pin  | 1             |
| Reserved              | [1]     | Reserved   | 0             |
| RnB<br>(Read-only)    | [0]     | The status of RnB input pin.<br>0 = NAND Flash memory busy<br>1 = NAND Flash memory ready to operate   | 1             |

## 13.11 ECC0/1 ERROR STATUS REGISTER

| Register | Address    | R/W | Description  | Reset Value |
|----------|------------|-----|--|-------------|
| NFECERR0 | 0x4E00002C | R   | NAND Flash ECC Error Status register for I/O [7:0] | 0xX0XX_XXXX |
| NFECERR1 | 0x4E000030 | R   | NAND Flash ECC Error Status register for I/O [7:0] | 0x0000_0000 |

## 13.11.1 When ECCType is 1-bit ECC.

| NFECERR0     | Bit     | Description   | Initial State |
|--------------|---------|---|---------------|
| Reserved     | [31:25] | Reserved  | 0x00          |
| SErrorDataNo | [24:21] | In spare area, Indicates which number data is error   | 0011          |
| SErrorBitNo  | [20:18] | In spare area, Indicates which bit is error   | 111           |
| MErrorDataNo | [17:7]  | In main data area, Indicates which number data is error   | 0x7FF         |
| MErrorBitNo  | [6:4]   | In main data area, Indicates which bit is error   | 111           |
| SpareError   | [3:2]   | Indicates whether spare area bit fail error occurred<br>00 = No Error<br>01 = 1-bit error(correctable)<br>10 = Uncorrectable<br>11 = ECC area error     | 10            |
| MainError    | [1:0]   | Indicates whether main data area bit fail error occurred<br>00 = No Error<br>01 = 1-bit error(correctable)<br>10 = Uncorrectable<br>11 = ECC area error | 10            |

| NFECERR1 | Bit    | Description | Initial State |
|----------|--------|-------------|---------------|
| Reserved | [31:0] | Reserved    | 0x00          |

**NOTE:** The above values are only valid when both ECC register and ECC status register have valid value.

## 13.11.2 When ECCType is 4-bit ECC.

| NFECERR0                           | Bit     | Description  | Initial State |
|------------------------------------|---------|--|---------------|
| ECC Busy                           | [31]    | Indicates the 4-bit ECC decoding engine is searching whether a error exists or not<br>0 = Idle<br>1 = Busy   | 0             |
| ECC Ready                          | [30]    | ECC Ready bit  | 1             |
| Reserved                           | [29]    | Reserved   | 0             |
| 4-bit MECC Error                   | [28:26] | 4-bit ECC decoding result<br>000 = No error<br>001 = 1-bit error<br>010 = 2-bit error<br>011 = 3-bit error<br>100 = 4-bit error<br>101 = Uncorrectable<br>11x = reserved<br><b>Note:</b> If it happens that there are more errors than 4 bits, 4-bit ECC module does not ensure right detection. | 000           |
| 2 <sup>nd</sup> Bit Error Location | [25:16] | Error byte location of 2 <sup>nd</sup> bit error   | 0x00          |
| Reserved                           | [15:10] | Reserved   |               |
| 1 <sup>st</sup> Bit Error Location | [9:0]   | Error byte location of 1 <sup>st</sup> bit error   | 0x00          |

**NOTE:** These values are updated when ECCDecDone (NFSTAT[6]) is set ('1').

| NFECERR1                           | Bit     | Description                                      | Initial State |
|------------------------------------|---------|--|---------------|
| Reserved                           | [31:26] | Reserved   | 0x00          |
| 4 <sup>th</sup> Bit Error Location | [25:16] | Error byte location of 4 <sup>th</sup> bit error | 0x00          |
| Reserved                           | [15:10] | Reserved   |               |
| 3 <sup>rd</sup> Bit Error Location | [9:0]   | Error byte location of 3 <sup>rd</sup> bit error | 0x00          |

**NOTE:** These values are updated when ECCDecDone (NFSTAT[6]) is set ('1').

## 13.12 MAIN DATA AREA ECC0 STATUS REGISTER

| Register | Address    | R/W | Description                    | Reset Value |
|----------|------------|-----|--------------------------------|-------------|
| NFMECC0  | 0x4E000034 | R   | NAND Flash ECC status register | 0xFFFFFFFF  |
| NFMECC1  | 0x4E000038 | R   | NAND Flash ECC status register | 0xFFFFFFFF  |

## 13.12.1 When ECCType is 1-bit ECC

| NFMECC0 | Bit     | Description        | Initial State |
|---------|---------|--------------------|---------------|
| MECC0_3 | [31:24] | ECC3 for data[7:0] | 0xXX          |
| MECC0_2 | [23:16] | ECC2 for data[7:0] | 0xXX          |
| MECC0_1 | [15:8]  | ECC1 for data[7:0] | 0xXX          |
| MECC0_0 | [7:0]   | ECC0 for data[7:0] | 0xXX          |

| NFMECC1  | Bit    | Description | Initial State |
|----------|--------|-------------|---------------|
| Reserved | [31:0] | Reserved    | 0x00000000    |

**NOTE:** The NAND flash controller generate NFMECC when read or write main area data while the MainECCLock (NFCONT[7]) bit is '0'(Unlock).

## 13.12.2 When ECCType is 4-bit ECC.

| NFMECC0                | Bit     | Description   | Initial State |
|------------------------|---------|---|---------------|
| 4 <sup>th</sup> Parity | [31:24] | 4 <sup>th</sup> Check Parity generated from main area | 0x00          |
| 3 <sup>rd</sup> Parity | [23:16] | 3 <sup>rd</sup> Check Parity generated from main area | 0x00          |
| 2 <sup>nd</sup> Parity | [15:8]  | 2 <sup>nd</sup> Check Parity generated from main area | 0x00          |
| 1 <sup>st</sup> Parity | [7:0]   | 1 <sup>st</sup> Check Parity generated from main area | 0x00          |

| NFMECC1                | Bit     | Description   | Initial State |
|------------------------|---------|---|---------------|
| Reserved               | [31:24] | Reserved  | 0x00          |
| 7 <sup>th</sup> Parity | [23:16] | 7 <sup>th</sup> Check Parity generated from main area | 0x00          |
| 6 <sup>th</sup> Parity | [15:8]  | 6 <sup>th</sup> Check Parity generated from main area | 0x00          |
| 5 <sup>th</sup> Parity | [7:0]   | 5 <sup>th</sup> Check Parity generated from main area | 0x00          |

**NOTE:** The NAND flash controller generate these ECC parity codes when write main area data while the MainECCLock (NFCONT[7]) bit is '0' (unlock).

## 13.13 SPARE AREA ECC STATUS REGISTER

| Register | Address    | R/W | Description                           | Reset Value |
|----------|------------|-----|---------------------------------------|-------------|
| NFSECC   | 0x4E00003C | R   | NAND Flash ECC register for I/O [7:0] | 0xFFFFFFFF  |

| NFSECC   | Bit     | Description                         | Initial State |
|----------|---------|-------------------------------------|---------------|
| Reserved | [31:16] | Reserved                            | 0XXXXX        |
| SECC0_1  | [15:8]  | Spare area ECC1 Status for I/O[7:0] | 0xXX          |
| SECC0_0  | [7:0]   | Spare area ECC0 Status for I/O[7:0] | 0xXX          |

**NOTE:** The NAND flash controller generate NFSECC when read or write spare area data while the SpareECCLock (NFCONT[6]) bit is '0' (Unlock).

## 13.14 4-BIT ECC ERROR PATTEN REGISTER

| Register   | Address    | R/W | Description   | Reset Value |
|------------|------------|-----|---|-------------|
| NFMLCBITPT | 0x4E000040 | R   | NAND Flash 4-bit ECC Error Pattern register for data[7:0] | 0x00000000  |

| NFMLCBITPT                        | Bit     | Description                       | Initial State |
|-----------------------------------|---------|-----------------------------------|---------------|
| 4 <sup>th</sup> Error bit pattern | [31:24] | 4 <sup>th</sup> Error bit pattern | 0x00          |

## CF CONTROLLER

### 1 OVERVIEW

CF controller supports PC card memory/IO mode & True-IDE mode.  
CF controller is compatible with CF standard spec. R3.0.

#### 1.1 FEATURES

##### 1.1.1 The CF Controller Features:

The CF controller supports only 1 slot.

The CF controller consists of 2 parts – PC card controller & ATA controller. They are multiplexing from or to PAD signals. Users have to use the only 1 mode, PC card or True-IDE mode. Default mode is PC card mode. The CF controller has a top level SFR that has card power enable bit, output port enable bit & mode select (True-IDE or PC card) bit.

##### 1.1.2 The PC Card Controller Features:

The PC card controller has 2 half-word (16bits) write buffers & 4 half-word (16bits) read buffers.

The PC card controller has 5 word-sized (32bits) Special Function Registers.

- 3 timing configuration registers. (Attribute memory, Common memory, I/O interface)
- 1 status & control configuration register
- 1 interrupt source & mask register

Timing configuration register consists of 3 parts – Setup, Command & Hold.

- PC card interface has 4 state (IDLE, SETUP, COMMAND & HOLD)
- Each part of register indicates the operation timing of each state.

##### 1.1.3 The ATA Controller Features:

The ATA controller is compatible with the ATA/ATAPI-6 standard.

The ATA controller support only PIO mode.

The ATA controller has 30 word-sized (32bits) Special Function Registers.

The ATA controller has 1 FIFO that is 16 x 32bit.

The ATA controller has internal DMA controller (from ATA device to memory or from memory to ATA device).

AHB master (DMA controller) support 8 burst & word size transfer.

## 1.2 SIGNAL DESCRIPTION

| CF Interface Signals | Pins | I/O | Description  |
|----------------------|------|-----|--|
| nCD_CF               | 1    | I   | Card detect signals (software control by GPIO MISCCR[30])  |
| nIREQ_CF(EINT[19])   | 1    | I   | Interrupt request from CF card.<br>PC card mode: active low (memory mode: level triggering, I/O mode: edge triggering). True-IDE mode: active high |
| nWAIT_CF(nWAIT)      | 1    | I   | Wait signal from CF card   |
| nINPACK(EINT[20])    | 1    | I   | Input acknowledge in I/O mode<br>PC card mode: not used<br>True-IDE mode: DMA request  |
| nCE1_CF(nRCS[2])     | 1    | O   | Card enable strobe<br>PC card mode : lower byte enable strobe<br>True-IDE mode : chip selection (nCS0)   |
| nCE2_CF(nRCS[3])     | 1    | O   | Card enable strobe<br>PC card mode: higher byte enable strobe<br>True-IDE mode: chip selection (nCS1)  |
| nREG_CF(EINT[21])    | 1    | O   | Register in CF card strobe<br>PC card mode: It is used for accessing register in CF card<br>True-IDE mode: DMA Acknowledge                         |
| nOE_CF(nOE_CF)       | 1    | O   | Output enable strobe<br>PC card mode: output enable strobe for memory<br>True-IDE mode: GND.   |
| nWE_CF(nWE_CF)       | 1    | O   | Write enable strobe<br>PC card mode: output enable strobe for memory<br>True-IDE mode: VCC.  |
| nIORD_CF(nROE)       | 1    | O   | Read strobe for I/O mode   |
| nIOWR_CF(nRWE)       | 1    | O   | Write strobe for I/O mode  |
| RESET_CF(EINT[22])   | 1    | O   | CF card reset<br>PC card mode: active high<br>True-IDE mode: active low  |
| ADDR_CF(RADDR[10:0]) | 11   | O   | CF card address<br>PC card mode: full address use<br>True-IDE mode: only ADDR[2:0] use, The other address line is connected to GND.                |
| DATA_CF(RDATA[15:0]) | 16   | I/O | CF data bus  |
| CARD_PWREN(EINT[23]) | 1    | O   | Card power enable strobe (active low)  |

1.3 BLOCK DIAGRAM

1.3.1 Top-Level Block Diagram

A top-level block diagram of the overall CF controller is shown below in Figure 8-1.

Figure 8-1. CF Controller Top Block Diagram

### 1.3.2 PC Card Controller Block Diagram

A top-level block diagram of the PC card controller is shown below in Figure 8-2.

Figure 8-2. PC Card Controller Top Block Diagram

1.3.3 ATA Controller Block Diagram

A top-level block diagram of the ATA controller is shown below in Figure 8-3.

## 2.9 ATA\_COMMAND REGISTER

| Register    | Address    | R/W | Description          | Reset Value |
|-------------|------------|-----|----------------------|-------------|
| ATA_COMMAND | 0x4B801908 | R/W | ATA Command register | 0x0000_0000 |

| ATA_COMMAND | Bits   | Description  | R/W | Reset Value |
|-------------|--------|--|-----|-------------|
| Reserved    | [31:2] | Reserved bits  | R   | 0x0         |
| xfr_command | [1:0]  | <p>ATA transfer command</p> <p>Four command types (START, STOP, ABORT and CONTINUE) are supported for data transfer control. The "START" command is used to start data transfer. The "STOP" command can pause transfer temporarily. The "CONTINUE" command shall be used after "STOP" command or internal state of "pause" when track buffer is full. The "ABORT" command terminated current data transfer sequences and make ATA host controller move to idle state.</p> <p>00 = command stop</p> <p>01 = command start (Only available in idle state)</p> <p>10 = command abort</p> <p>11 = command continue (Only available in transfer pause)</p> <p>** After CPU commands ABORT, make a software reset by ATA_SWRST to clear the leftover values of internal registers.</p> | R/W | 0x0         |

The STOP command is a thing, which use when CPU wants to pause upon data transfer. When the CPU wants to judge the transmission data is valid or not while transfer transmits, for a moment.

To send data continually, give a CONTINUE command to do data transmission continuously.

The STOP command does control ATA Device side signal but does not control DMA side. Namely, if the FIFO has data after STOP command, DMA operation progresses until the FIFO has empty at read operation. In case of write operation, the DMA acts the same way until the FIFO has full.

The ABORT command uses when the transmitting data has proved useless data or discontinues absurd state by error interrupt from device.

At that time, all data in ATA Host controller (register, FIFO) cleared and the transmission state machine goes to IDLE.

The Software Reset's meaning become clear all registers even though the ABORT command had been executed before do configuration register set for next transmission. But it is not mandatory.

## 2.10 ATA\_SWRST REGISTER

| Register  | Address    | R/W | Description            | Reset Value |
|-----------|------------|-----|------------------------|-------------|

## NOTES

# 9

## DMA CONTROLLER

### 1 OVERVIEW

S3C2451 supports eight-channel DMA (Bridge DMA or peripheral DMA) controller that is located between the system bus and the peripheral bus. Each channel of DMA controller can perform data movements between devices in the system bus and/or peripheral bus with no restrictions. In other words, each channel can handle the following four cases: 1) both source and destination are in the system bus, 2) source is in the system bus while destination is in the peripheral bus, 3) source is in the peripheral bus while destination is in the system bus, 4) both source and destination are in the peripheral bus.

The main advantage of DMA is that it can transfer the data without CPU intervention. The operation of DMA can be initiated by S/W, or the request from internal peripherals, or the external request pins.

## 2 DMA REQUEST SOURCES

Each channel of DMA controller can select one source among 27 DMA sources if H/W DMA request mode is selected by REQSEL register. (Note that if S/W request mode is selected, this DMA request sources have no meaning at all.) The 27 DMA sources for each channel are as follows.

**Table 9-1. DMA request sources for each channel**

| Bit | Source   | Bit | Source    | Bit | Source    | Bit | Source    |
|-----|----------|-----|-----------|-----|-----------|-----|-----------|
| 0   | SPI_0_TX | 8   | Reserved  | 16  | Reserved  | 24  | UART_2[1] |
| 1   | SPI_0_RX | 9   | PWM Timer | 17  | nXDREQ0   | 25  | UART_3[0] |
| 2   | SPI_1_TX | 10  | Reserved  | 18  | nXDREQ1   | 26  | UART_3[1] |
| 3   | SPI_1_RX | 11  | Reserved  | 19  | UART_0[0] | 27  | PCMOUT    |
| 4   | I2S TX   | 12  | PCM0 TX   | 20  | UART_0[1] | 28  | PCMIN     |
| 5   | I2S RX   | 13  | PCM0 RX   | 21  | UART_1[0] | 29  | MICIN     |
| 6   | I2S1 TX  | 14  | PCM1 TX   | 22  | UART_1[1] | 30  | Reserved  |
| 7   | I2S1 RX  | 15  | PCM1 RX   | 23  | UART_2[0] | 31  | Reserved  |

Here, nXDREQ0 and nXDREQ1 represent two external sources (External Devices).

### 3 DMA OPERATION

The details of DMA operation can be explained using three-state FSM (finite state machine) as follows:

- State-1. As an initial state, it waits for the DMA request. If it comes, go to state-2. At this state, DMA ACK and INT REQ are 0.
- State-2. In this state, DMA ACK becomes 1 and the counter (CURR\_TC) is loaded from DCON[19:0] register. Note that DMA ACK becomes 1 and remains 1 until it is cleared later.
- State-3. In this state, sub-FSM handling the atomic operation of DMA is initiated. The sub-FSM reads the data from the source address and then writes it to destination address. In this operation, data size and transfer size (single or burst) are considered. This operation is repeated until the counter (CURR\_TC) becomes 0 in the whole service mode, while performed only once in a single service mode. The main FSM (this FSM) counts down the CURR\_TC when the sub-FSM finishes each of atomic operation. In addition, this main FSM asserts the INT REQ signal when CURR\_TC becomes 0 and the interrupt setting of DCON [29] register is set to 1. In addition, it clears DMA ACK if one of the following conditions is met.
  - 1) CURR\_TC becomes 0 in the whole service mode
  - 2) atomic operation finishes in the single service mode.

Note that in the single service mode, these three states of main FSM are performed and then stops, and wait for another DMA REQ. And if DMA REQ comes in all three states are repeated. Therefore, DMA ACK is asserted and then de-asserted for each atomic transfer. In contrast, in the whole service mode, main FSM waits at state-3 until CURR\_TC becomes 0. Therefore, DMA ACK is asserted during all the transfers and then de-asserted when TC reaches 0.

However, INT REQ is asserted only if CURR\_TC becomes 0 regardless of the service mode (single service mode or whole service mode).

### 3.1 EXTERNAL DMA DREQ/DACK PROTOCOL

There are four types of external DMA request/acknowledge protocols. Each type defines how the signals like DMA request and acknowledge are related to these protocols.

#### 3.1.1 Basic DMA Timing

The DMA service means paired Reads and Writes cycles during DMA operation, which is one DMA operation. The Figure 9-1 shows the basic Timing in the DMA operation of the S3C2451.

- The setup time and the delay time of XnXDREQ and XnXDACK are same in all the modes.
- If the completion of XnXDREQ meets its setup time, it is synchronized twice and then XnXDACK is asserted.
- After assertion of XnXDACK, DMA requests the bus and if it gets the bus it performs its operations. XnXDACK is deasserted when DMA operation finishes.

Figure 9-1. Basic DMA Timing Diagram

Demand/Handshake Mode Comparison – Related to the Protocol between XnXDREQ and XnXDACK

These are two different modes related to the protocol between XnXDREQ and XnXDACK. Figure 9-2 shows the differences between these two modes i.e., Demand and Handshake modes.

At the end of one transfer (Single/Burst transfer), DMA checks the state of double-synched XnXDREQ.

3.1.2 Demand mode

- If XnXDREQ remains asserted, the next transfer starts immediately. Otherwise it waits for XnXDREQ to be asserted.

3.1.3 Handshake mode

- If XnXDREQ is deasserted, DMA deasserts XnXDACK in 2cycles. Otherwise it waits until XnXDREQ is deasserted.

Caution: XnXDREQ has to be asserted (low) only after the deassertion (high) of XnXDACK.

Figure 9-2. Demand/Handshake Mode Comparison

### 3.1.4 Transfer Size

- There are two different transfer sizes; single and Burst 4.
- DMA holds the bus firmly during the transfer of these chunk of data, thus other bus masters can not get the bus.

### 3.1.5 Burst 4 Transfer Size

4 sequential Reads and 4 sequential Writes are performed in the Burst 4 Transfer.

#### NOTE

Single Transfer size: One read and one write are performed.

Figure 9-3. Burst 4 Transfer size

3.2 EXAMPLES OF POSSIBLE CASES

3.2.1 Single service, Demand Mode, Single Transfer Size

The assertion of XnXDREQ is need for every unit transfer (Single service mode), the operation continues while the XnXDREQ is asserted(Demand mode), and one pair of Read and Write(Single transfer size) is performed.

Figure 9-4. Single service, Demand Mode, Single Transfer Size

Single service/Handshake Mode, Single Transfer Size

Figure 9-5. Single service, Handshake Mode, Single Transfer Size

Whole service/Handshake Mode, Single Transfer Size

Figure 9-6. Whole service, Handshake Mode, Single Transfer Size

## 4 DMA SPECIAL REGISTERS

There are 10 control registers for each DMA channel. (Since there are six channels, the total number of control registers is 60.) Seven of them are to control the DMA transfer, and other three are to see the status of DMA controller. The details of those registers are as follows.

### 4.1 DMA INITIAL SOURCE REGISTER (DISRC)

| Register | Address    | R/W | Description                  | Reset Value |
|----------|------------|-----|------------------------------|-------------|
| DISRC0   | 0x4B000000 | R/W | DMA0 Initial Source Register | 0x00000000  |
| DISRC1   | 0x4B000100 | R/W | DMA1 Initial Source Register | 0x00000000  |
| DISRC2   | 0x4B000200 | R/W | DMA2 Initial Source Register | 0x00000000  |
| DISRC3   | 0x4B000300 | R/W | DMA3 Initial Source Register | 0x00000000  |
| DISRC4   | 0x4B000400 | R/W | DMA4 Initial Source Register | 0x00000000  |
| DISRC5   | 0x4B000500 | R/W | DMA5 Initial Source Register | 0x00000000  |
| DISRC6   | 0x4B000600 | R/W | DMA6 Initial Source Register | 0x00000000  |
| DISRC7   | 0x4B000700 | R/W | DMA7 Initial Source Register | 0x00000000  |

| DISRCn | Bit    | Description   | Initial State |
|--------|--------|---|---------------|
| S_ADDR | [30:0] | These bits are the base address (start address) of source data to transfer. This value will be loaded into CURR_SRC only if the CURR_SRC is 0 and the DMA ACK is 1. | 0x00000000    |

## 4.2 DMA INITIAL SOURCE CONTROL REGISTER (DISRCC)

| Register | Address    | R/W | Description                          | Reset Value |
|----------|------------|-----|--------------------------------------|-------------|
| DISRCC0  | 0x4B000004 | R/W | DMA0 Initial Source Control Register | 0x00000000  |
| DISRCC1  | 0x4B000104 | R/W | DMA1 Initial Source Control Register | 0x00000000  |
| DISRCC2  | 0x4B000204 | R/W | DMA2 Initial Source Control Register | 0x00000000  |
| DISRCC3  | 0x4B000304 | R/W | DMA3 Initial Source Control Register | 0x00000000  |

| DISRCn | Bit | Description  | Initial State |
|--------|-----|--|---------------|
| LOC    | [1] | Bit 1 is used to select the location of source.<br>0 = The source is in the system bus (AHB),<br>1 = The source is in the peripheral bus (APB)   | 0             |
| INC    | [0] | Bit 0 is used to select the address increment.<br>0 = Increment<br>1 = Fixed<br>If it is 0, the address is increased by its data size after each transfer in burst and single transfer mode.<br>If it is 1, the address is not changed after the transfer (In the burst mode, address is increased during the burst transfer, but the address is recovered to its first value after the transfer). | 0             |

## 4.3 DMA INITIAL DESTINATION REGISTER (DIDST)

| Register | Address    | R/W | Description                       | Reset Value |
|----------|------------|-----|-----------------------------------|-------------|
| DIDST0   | 0x4B000008 | R/W | DMA0 Initial Destination Register | 0x00000000  |
| DIDST1   | 0x4B000108 | R/W | DMA1 Initial Destination Register | 0x00000000  |
| DIDST2   | 0x4B000208 | R/W | DMA2 Initial Destination Register | 0x00000000  |
| DIDST3   | 0x4B000308 | R/W | DMA3 Initial Destination Register | 0x00000000  |
| DIDST4   | 0x4B000408 | R/W | DMA4 Initial Destination Register | 0x00000000  |
| DIDST5   | 0x4B000508 | R/W | DMA5 Initial Destination Register | 0x00000000  |
| DIDST6   | 0x4B000608 | R/W | DMA6 Initial Destination Register | 0x00000000  |
| DIDST7   | 0x4B000708 | R/W | DMA7 Initial Destination Register | 0x00000000  |

| DIDSTn | Bit    | Description  | Initial State |
|--------|--------|--|---------------|
| D_ADDR | [30:0] | These bits are the base address (start address) of destination for the transfer. This value will be loaded into CURR_SRC only if the CURR_SRC is 0 and the DMA ACK is 1. | 0x00000000    |

## 4.4 DMA INITIAL DESTINATION CONTROL REGISTER (DIDSTC)

| Register | Address    | R/W | Description                               | Reset Value |
|----------|------------|-----|---|-------------|
| DIDSTC0  | 0x4B00000C | R/W | DMA0 Initial Destination Control Register | 0x00000000  |
| DIDSTC1  | 0x4B00010C | R/W | DMA1 Initial Destination Control Register | 0x00000000  |
| DIDSTC2  | 0x4B00020C | R/W | DMA2 Initial Destination Control Register | 0x00000000  |
| DIDSTC3  | 0x4B00030C | R/W | DMA3 Initial Destination Control Register | 0x00000000  |
| DIDSTC4  | 0x4B00040C | R/W | DMA4 Initial Destination Control Register | 0x00000000  |
| DIDSTC5  | 0x4B00050C | R/W | DMA5 Initial Destination Control Register | 0x00000000  |
| DIDSTC6  | 0x4B00060C | R/W | DMA6 Initial Destination Control Register | 0x00000000  |
| DIDSTC7  | 0x4B00070C | R/W | DMA7 Initial Destination Control Register | 0x00000000  |

| DIDSTn  | Bit | Description  | Initial State |
|---------|-----|--|---------------|
| CHK_INT | [2] | Select interrupt occurrence time when auto reload is setting<br>0 = Interrupt will occur when TC reaches 0.<br>1 = Interrupt will occur after auto-reload is performed   | 0             |
| LOC     | [1] | Bit 1 is used to select the location of destination.<br>0 = The destination is in the system bus (AHB).<br>1 = The destination is in the peripheral bus (APB).   | 0             |
| INC     | [0] | Bit 0 is used to select the address increment.<br>0 = Increment<br>1 = Fixed<br>If it is 0, the address is increased by its data size after each transfer in burst and single transfer mode.<br>If it is 1, the address is not changed after the transfer (In the burst mode, address is increased during the burst transfer, but the address is recovered to its first value after the transfer). | 0             |

## 4.5 DMA CONTROL REGISTER (DCON)

| Register | Address    | R/W | Description           | Reset Value |
|----------|------------|-----|-----------------------|-------------|
| DCON0    | 0x4B000010 | R/W | DMA0 Control Register | 0x00000000  |
| DCON1    | 0x4B000110 | R/W | DMA1 Control Register | 0x00000000  |
| DCON2    | 0x4B000210 | R/W | DMA2 Control Register | 0x00000000  |
| DCON3    | 0x4B000310 | R/W | DMA3 Control Register | 0x00000000  |
| DCON4    | 0x4B000410 | R/W | DMA4 Control Register | 0x00000000  |
| DCON5    | 0x4B000510 | R/W | DMA5 Control Register | 0x00000000  |
| DCON6    | 0x4B000610 | R/W | DMA6 Control Register | 0x00000000  |
| DCON7    | 0x4B000710 | R/W | DMA7 Control Register | 0x00000000  |

| DCONn  | Bit  | Description  | Initial State |
|--------|------|--|---------------|
| DMD_HS | [31] | Select one between demand mode and handshake mode.<br>0 = demand mode is selected<br>1 = handshake mode is selected.<br><br>In both modes, DMA controller starts its transfer and asserts DACK for a given asserted DREQ. The difference between two modes is whether it waits for the de-asserted DACK or not. In handshake mode, DMA controller waits for the de-asserted DREQ before starting a new transfer. If it sees the de-asserted DREQ, it de-asserts DACK and waits for another asserted DREQ. In contrast, in the demand mode, DMA controller does not wait until the DREQ is de-asserted. It just de-asserts DACK and then starts another transfer if DREQ is asserted. We recommend using handshake mode for external DMA request sources to prevent unintended starts of new transfers. | 0             |
| SYNC   | [30] | Select DREQ/DACK synchronization.<br>0 = DREQ and DACK are synchronized to PCLK (APB clock).<br>1 = DREQ and DACK are synchronized to HCLK (AHB clock).<br><br>Therefore, devices attached to AHB system bus, this bit has to be set to 1, while those attached to APB system, it should be set to 0. For the devices attached to external system, user should select this bit depending on whether the external system is synchronized with AHB system or APB system.   | 0             |
| INT    | [29] | Enable/Disable the interrupt setting for CURR_TC (terminal count)<br>0 = CURR_TC interrupt is disabled. User has to look the transfer count in the status register. (i.e., polling)<br>1 = Interrupt request is generated when all the transfer is done (i.e., CURR_TC becomes 0).   | 0             |
| TSZ    | [28] | Select the transfer size of an atomic transfer (i.e., transfer performed at each time DMA owns the bus before releasing the bus).<br>0 = A unit transfer is performed.<br>1 = A burst transfer of length four is performed.  | 0             |

| DCONn    | Bit     | Description  | Initial State |
|----------|---------|--|---------------|
| SERVMODE | [27]    | Select the service mode between single service mode and whole service mode.<br><br>0 = Single service mode is selected in which after each atomic transfer (single or burst of length four) DMA stops and waits for another DMA request.<br><br>1 = Whole service mode is selected in which one request gets atomic transfers to be repeated until the transfer count reaches to 0. In this mode, additional request is not required. Here, note that even in the whole service mode, DMA releases the bus after each atomic transfer and then tries to re-get the bus to prevent starving of other bus masters. | 0             |
| Reserved | [26:25] | Reserved for future use  | 00            |
| PADDRFIX | [24]    | APB Address fix control<br><br>0 = Increment<br>1 = Fix<br><br>If you want to fix the APB address during burst operation, set this bit to 1.   | 0             |
| Reserved | [23]    | Reserved for future use  | 0             |
| RELOAD   | [22]    | Set the reload on/off option.<br><br>0 = Auto reload is performed when a current value of transfer count becomes 0 (i.e., all the required transfers are performed).<br><br>1 = DMA channel (DMA REQ) is turned off when a current value of transfer count becomes 0. The channel on/off bit(DMASKTRIGN[1]) is set to 0(DREQ off) to prevent unintended further start of new DMA operation   | 0             |
| DSZ      | [21:20] | Data size to be transferred.<br><br>00 = Byte<br>01 = Half word<br>10 = Word<br>11 = Reserved  | 00            |
| TC       | [19:0]  | Initial transfer count (or transfer beat).<br><br>Note that the actual number of bytes that are transferred is computed by the following equation: DSZ x TSZ x TC, where DSZ, TSZ, and TC represent data size (DCONn[21:20]), transfer size (DCONn[28]), and initial transfer count, respectively.<br><br>This value will be loaded into CURR_TC only if the CURR_TC is 0 and the DMA ACK is 1.  | 00000         |

## 4.6 DMA STATUS REGISTER (DSTAT)

| Register | Address    | R/W | Description         | Reset Value |
|----------|------------|-----|---------------------|-------------|
| DSTAT0   | 0x4B000014 | R   | DMA0 Count Register | 000000h     |
| DSTAT1   | 0x4B000114 | R   | DMA1 Count Register | 000000h     |
| DSTAT2   | 0x4B000214 | R   | DMA2 Count Register | 000000h     |
| DSTAT3   | 0x4B000314 | R   | DMA3 Count Register | 000000h     |
| DSTAT4   | 0x4B000414 | R   | DMA4 Count Register | 000000h     |
| DSTAT5   | 0x4B000514 | R   | DMA5 Count Register | 000000h     |
| DSTAT6   | 0x4B000614 | R   | DMA6 Count Register | 000000h     |
| DSTAT7   | 0x4B000714 | R   | DMA7 Count Register | 000000h     |

| DSTATn  | Bit     | Description  | Initial State |
|---------|---------|--|---------------|
| STAT    | [21:20] | Status of this DMA controller.<br>00 = It indicates that DMA controller is ready for another DMA request.<br>01 = It indicates that DMA controller is busy for transfers.    | 00b           |
| CURR_TC | [19:0]  | Current value of transfer count.<br>Note that transfer count is initially set to the value of DCONn[19:0] register and decreased by one at the end of every atomic transfer. | 00000h        |

## 4.7 DMA CURRENT SOURCE REGISTER (DCSRC)

| Register | Address     | R/W | Description                  | Reset Value |
|----------|-------------|-----|------------------------------|-------------|
| DCSRC0   | 0x4B000018  | R   | DMA0 Current Source Register | 0x00000000  |
| DCSRC1   | 0x4B000018  | R   | DMA1 Current Source Register | 0x00000000  |
| DCSRC2   | 0x4B0000218 | R   | DMA2 Current Source Register | 0x00000000  |
| DCSRC3   | 0x4B0000318 | R   | DMA3 Current Source Register | 0x00000000  |
| DCSRC4   | 0x4B0000418 | R   | DMA4 Current Source Register | 0x00000000  |
| DCSRC5   | 0x4B0000518 | R   | DMA5 Current Source Register | 0x00000000  |
| DCSRC6   | 0x4B0000618 | R   | DMA6 Current Source Register | 0x00000000  |
| DCSRC7   | 0x4B0000718 | R   | DMA7 Current Source Register | 0x00000000  |

| DCSRCn   | Bit    | Description                                   | Initial State |
|----------|--------|---|---------------|
| CURR_SRC | [30:0] | Current source address for DMA <sub>n</sub> . | 0x00000000    |

## 4.8 CURRENT DESTINATION REGISTER (DCDST)

| Register | Address     | R/W | Description                       | Reset Value |
|----------|-------------|-----|-----------------------------------|-------------|
| DCDST0   | 0x4B00001C  | R   | DMA0 Current Destination Register | 0x00000000  |
| DCDST1   | 0x4B000011C | R   | DMA1 Current Destination Register | 0x00000000  |
| DCDST2   | 0x4B000021C | R   | DMA2 Current Destination Register | 0x00000000  |
| DCDST3   | 0x4B000031C | R   | DMA3 Current Destination Register | 0x00000000  |
| DCDST4   | 0x4B000041C | R   | DMA4 Current Destination Register | 0x00000000  |
| DCDST5   | 0x4B000051C | R   | DMA5 Current Destination Register | 0x00000000  |
| DCDST6   | 0x4B000061C | R   | DMA6 Current Destination Register | 0x00000000  |
| DCDST7   | 0x4B000071C | R   | DMA7 Current Destination Register | 0x00000000  |

| DCDSTn   | Bit    | Description  | Initial State |
|----------|--------|--|---------------|
| CURR_DST | [30:0] | Current destination address for DMA <sub>n</sub> . | 0x00000000    |

## 4.9 DMA MASK TRIGGER REGISTER (DMASKTRIG)

| Register   | Address    | R/W | Description                | Reset Value |
|------------|------------|-----|----------------------------|-------------|
| DMASKTRIG0 | 0x4B000020 | R/W | DMA0 Mask Trigger Register | 000         |
| DMASKTRIG1 | 0x4B000120 | R/W | DMA1 Mask Trigger Register | 000         |
| DMASKTRIG2 | 0x4B000220 | R/W | DMA2 Mask Trigger Register | 000         |
| DMASKTRIG3 | 0x4B000320 | R/W | DMA3 Mask Trigger Register | 000         |
| DMASKTRIG4 | 0x4B000420 | R/W | DMA4 Mask Trigger Register | 000         |
| DMASKTRIG5 | 0x4B000520 | R/W | DMA5 Mask Trigger Register | 000         |
| DMASKTRIG6 | 0x4B000620 | R/W | DMA6 Mask Trigger Register | 000         |
| DMASKTRIG7 | 0x4B000720 | R/W | DMA7 Mask Trigger Register | 000         |

| DMASKTRIGn | Bit | Description   | Initial State |
|------------|-----|---|---------------|
| STOP       | [2] | <p>Stop the DMA operation.</p> <p>1 = DMA stops as soon as the current atomic transfer ends. If there is no current running atomic transfer, DMA stops immediately. The CURR_TC, CURR_SRC, CURR_DST will be 0.</p> <p><b>Note:</b> Due to possible current atomic transfer, "stop" may take several cycles. The finish of "stopping" operation (i.e., actual stop time) can be detected by waiting until the channel on/off bit (DMASKTRIGn[1]) is set to off. This stop is "actual stop".</p>  | 0             |
| ON_OFF     | [1] | <p>DMA channel on/off bit.</p> <p>0 = DMA channel is turned off. (DMA request to this channel is ignored.)</p> <p>1 = DMA channel is turned on and the DMA request is handled. This bit is automatically set to off if we set the DCONn[22] bit to "no auto reload" and/or STOP bit of DMASKTRIGn to "stop". Note that when DCON [22] bit is "no auto reload", this bit becomes 0 when CURR_TC reaches 0. If the STOP bit is 1, this bit becomes 0 as soon as the current atomic transfer finishes.</p> <p><b>Note:</b> This bit should not be changed manually during DMA operations (i.e., this has to be changed only by using DCON [22] or STOP bit.)</p> | 0             |
| SW_TRIG    | [0] | <p>Trigger the DMA channel in S/W request mode.</p> <p>1 = it requests a DMA operation to this controller.</p> <p>However, note that for this trigger to have effects S/W request mode has to be selected (DCONn[23]) and channel ON_OFF bit has to be set to 1 (channel on). When DMA operation starts, this bit is cleared automatically.</p>   | 0             |

**NOTE:** You can freely change the values of DISRC register, DIDST registers, and TC field of DCON register. Those changes take effect only after the finish of current transfer (i.e., when CURR\_TC becomes 0). On the other hand, any change made to other registers and/or fields takes immediate effect. Therefore, be careful in changing those registers and fields.

## 4.10 DMA REQUESET SELECTION REGISTER (DMAREQSEL)

| Register   | Address    | R/W | Description                     | Reset Value |
|------------|------------|-----|---------------------------------|-------------|
| DMAREQSEL0 | 0x4B000024 | R/W | DMA0 Request Selection Register | 000         |
| DMAREQSEL1 | 0x4B000124 | R/W | DMA1 Request Selection Register | 000         |
| DMAREQSEL2 | 0x4B000224 | R/W | DMA2 Request Selection Register | 000         |
| DMAREQSEL3 | 0x4B000324 | R/W | DMA3 Request Selection Register | 000         |
| DMAREQSEL4 | 0x4B000424 | R/W | DMA4 Request Selection Register | 000         |
| DMAREQSEL5 | 0x4B000524 | R/W | DMA5 Request Selection Register | 000         |
| DMAREQSEL6 | 0x4B000624 | R/W | DMA6 Request Selection Register | 000         |
| DMAREQSEL7 | 0x4B000724 | R/W | DMA7 Request Selection Register | 000         |

| DMAREQSELn | Bit   | Description   | Initial State |
|------------|-------|---|---------------|
| HWSRCSEL   | [5:1] | Select DMA request source for each DMA.<br>→ Refer to the Table 11-1 on page 11-2.<br>This bits control the 8-1 MUX to select the DMA request source of each DMA. These bits have meanings if and only if H/W request mode is selected by DMAREQSELn[0].                                | 00000         |
| SWHW_SEL   | [0]   | Select the DMA source between software (S/W request mode) and hardware (H/W request mode).<br>0 = S/W request mode is selected and DMA is triggered by setting SW_TRIG bit of DMASKTRIG control register.<br>1 = DMA source selected by bit [5:1] is used to trigger the DMA operation. | 0             |

## NOTES

# 10 INTERRUPT CONTROLLER

## 1 OVERVIEW

The interrupt controller in the S3C2451 receives the request from 59 interrupt sources. These interrupt sources are provided by internal peripherals such as the DMA controller, the UART, IIC, and others. In these interrupt sources, the UARTn and EINTn interrupts are 'OR'ed to the interrupt controller.

When receiving multiple interrupt requests from internal peripherals and external interrupt request pins, the interrupt controller requests FIQ or IRQ interrupt of the ARM926EJ core after the arbitration procedure.

The arbitration procedure depends on the hardware priority logic and the result is written to the interrupt pending register, which helps users notify which interrupt is generated out of various interrupt sources.

Figure 10-1. Interrupt Process Diagram

The interrupt controller has two groups of interrupt sources, and first group has always higher priority than the other group. Actually, we made this interrupt controller using by two interrupt controllers. The nRIQ of ARM926EJ is connected with 'AND' of nIRQs of each interrupt controller. The nFIQ is just same.

Figure 10-2. Interrupt Group Multiplexing Diagram

## 1.1 INTERRUPT CONTROLLER OPERATION

### 1.1.1 F-bit and I-bit of Program Status Register (PSR)

If the F-bit of PSR in ARM926EJ CPU is set to 1, the CPU does not accept the Fast Interrupt Request (FIQ) from the interrupt controller. Likewise, If I-bit of the PSR is set to 1, the CPU does not accept the Interrupt Request (IRQ) from the interrupt controller. So, the interrupt controller can receive interrupts by clearing F-bit or I-bit of the PSR to 0 and setting the corresponding bit of INTMSK to 0.

### 1.1.2 Interrupt Mode

The ARM926EJ has two types of Interrupt mode: FIQ or IRQ. All the interrupt sources determine which mode is used at interrupt request.

### 1.1.3 Interrupt Pending Register

The **S3C2451** has two interrupt pending registers: source pending register (SRCPND) and interrupt pending register (INTPND). These pending registers indicate whether or not an interrupt request is pending. When the interrupt sources request interrupt service, the corresponding bits of SRCPND register are set to 1, and at the same time, only one bit of the INTPND register is set to 1 automatically after arbitration procedure. If interrupts are masked, the corresponding bits of the SRCPND register are set to 1. This does not cause the bit of INTPND register changed. When a pending bit of the INTPND register is set, the interrupt service routine starts whenever the I-flag or F-flag is cleared to 0. The SRCPND and INTPND registers can be read and written, so the service routine must clear the pending condition by writing a 1 to the corresponding bit in the SRCPND register first and then clear the pending condition in the INTPND registers by using the same method.

### 1.1.4 Interrupt Mask Register

This register indicates that an interrupt has been disabled if the corresponding mask bit is set to 1. If an interrupt mask bit of INTMSK is 0, the interrupt will be serviced normally. If the corresponding mask bit is 1 and the interrupt is generated, the source pending bit will be set.

## 1.2 INTERRUPT SOURCES

The interrupt controller supports 51 interrupt sources as shown in the table below.

| Sources  | Descriptions                                 | Arbiter Group |

### 1.3 INTERRUPT PRIORITY GENERATING BLOCK

The priority logic for 32 interrupt requests is composed of seven rotation based arbiters: six first-level arbiters and one second-level arbiter as shown in Figure 10-2 below.

Figure 10-3. Priority Generating Block

## 1.4 INTERRUPT PRIORITY

We have two groups of arbiters. One group is ARBITER0~ARBITER5, and the other is ARBITER6~ARBITER11. The former group has higher priority than the latter group. And priority of arbiters in each group can be set as below separately.

Each arbiter can handle six interrupt requests based on the one bit arbiter mode control (ARB\_MODE) and two bits of selection control signals (ARB\_SEL) as follows:

- If ARB\_SEL bits are 00b, the priority order is REQ0, REQ1, REQ2, REQ3, REQ4, and REQ5.
- If ARB\_SEL bits are 01b, the priority order is REQ0, REQ2, REQ3, REQ4, REQ1, and REQ5.
- If ARB\_SEL bits are 10b, the priority order is REQ0, REQ3, REQ4, REQ1, REQ2, and REQ5.
- If ARB\_SEL bits are 11b, the priority order is REQ0, REQ4, REQ1, REQ2, REQ3, and REQ5.

Note that REQ0 of an arbiter always has the highest priority, and REQ5 has the lowest one. In addition, by changing the ARB\_SEL bits, we can rotate the priority of REQ1 to REQ4.

Here, if ARB\_MODE bit is set to 0, ARB\_SEL bits are not automatically changed, making the arbiter to operate in the fixed priority mode (note that even in this mode, we can reconfigure the priority by manually changing the ARB\_SEL bits). On the other hand, if ARB\_MODE bit is 1, ARB\_SEL bits are changed in rotation fashion, e.g., if REQ1 is serviced, ARB\_SEL bits are changed to 01b automatically so as to put REQ1 into the lowest priority. The detailed rules of ARB\_SEL change are as follows:

- If REQ0 or REQ5 is serviced, ARB\_SEL bits are not changed at all.
- If REQ1 is serviced, ARB\_SEL bits are changed to 01b.
- If REQ2 is serviced, ARB\_SEL bits are changed to 10b.
- If REQ3 is serviced, ARB\_SEL bits are changed to 11b.
- If REQ4 is serviced, ARB\_SEL bits are changed to 00b.

## 2 INTERRUPT CONTROLLER SPECIAL REGISTERS

There are following control registers in the interrupt controller: source pending register, interrupt mode register, mask register, priority register, interrupt pending register, interrupt offset register, sub-source pending register and sub-mask register.

All the interrupt requests from the interrupt sources are first registered in the source pending register. They are divided into two groups including Fast Interrupt Request (FIQ) and Interrupt Request (IRQ), based on the interrupt mode register. The arbitration procedure for multiple IRQs is based on the priority register.

### Overall Register Map

| Register         | Address    | R/W | Description   | Reset Value |
|------------------|------------|-----|---|-------------|
| SRCPND 1         | 0X4A000000 | R/W | Indicate the interrupt request status for group 1.<br>0 = The interrupt has not been requested.<br>1 = The interrupt source has asserted the interrupt request.                     | 0x00000000  |
| INTMOD 1         | 0X4A000004 | R/W | Interrupt mode register for group 1.<br>0 = IRQ mode<br>1 = FIQ mode  | 0x00000000  |
| INTMSK1          | 0X4A000008 | R/W | Determine which interrupt source of group 1 is masked. The masked interrupt source will not be serviced.<br>0 = Interrupt service is available.<br>1 = Interrupt service is masked. | 0xFFFFFFFF  |
|                  | 0X4A00000C |     |   |             |
| INTPND1          | 0X4A000010 | R/W | Indicate the interrupt request status for group 1.<br>0 = The interrupt has not been requested.<br>1 = The interrupt source has asserted the interrupt request.                     | 0x00000000  |
| INTOFFSET1       | 0X4A000014 | R   | Indicate the IRQ interrupt request source for group 1   | 0x00000000  |
| SUBSRCPND        | 0X4A000018 | R/W | Indicate the interrupt request status.<br>0 = The interrupt has not been requested.<br>1 = The interrupt source has asserted the interrupt request.                                 | 0x00000000  |
| INTSUBMSK        | 0X4A00001C | R/W | Determine which interrupt source is masked. The masked interrupt source will not be serviced.<br>0 = Interrupt service is available.<br>1 = Interrupt service is masked.            | 0xFFFFFFFF  |
| PRIORITY_MODE1   | 0x4A000030 | R/W | IRQ priority mode register  | 0x00000000  |
| PRIORITY_UPDATE1 | 0x4A000034 | R/W | IRQ priority update register  | 0x7F        |
| SRCPND 2         | 0X4A000040 | R/W | Indicate the interrupt request status for group 2..<br>0 = The interrupt has not been requested.<br>1 = The interrupt source has asserted the interrupt                             | 0x00000000  |

| Register         | Address    | R/W | Description   | Reset Value |
|------------------|------------|-----|---|-------------|
|                  |            |     | request.  |             |
| INTMOD 2         | 0X4A000044 | R/W | Interrupt mode register for group 2.<br>0 = IRQ mode<br>1 = FIQ mode  | 0x00000000  |
| INTMSK2          | 0X4A000048 | R/W | Determine which interrupt source of group 2 is masked. The masked interrupt source will not be serviced.<br>0 = Interrupt service is available.<br>1 = Interrupt service is masked. | 0xFFFFFFFF  |
| INTPND2          | 0X4A000050 | R/W | Indicate the interrupt request status for group 2.<br>0 = The interrupt has not been requested.<br>1 = The interrupt source has asserted the interrupt request.                     | 0x00000000  |
| INTOFFSET2       | 0X4A000054 | R   | Indicate the IRQ interrupt request source for group 2   | 0x00000000  |
| PRIORITY_MODE2   | 0x4A000070 | R/W | IRQ priority mode register 2  | 0x00000000  |
| PRIORITY_UPDATE2 | 0x4A000074 | R/W | IRQ priority update register 2  | 0x7F        |

**2.1 SOURCE PENDING (SRCPND) REGISTER**

The SRCPND register is composed of 32 bits each of which is related to an interrupt source. Each bit is set to 1 if the corresponding interrupt source generates the interrupt request and waits for the interrupt to be serviced. Accordingly, this register indicates which interrupt source is waiting for the request to be serviced. Note that each bit of the SRCPND register is automatically set by the interrupt sources regardless of the masking bits in the INTMASK register. In addition, the SRCPND register is not affected by the priority logic of interrupt controller.

In the interrupt service routine for a specific interrupt source, the corresponding bit of the SRCPND register has to be cleared to get the interrupt request from the same source correctly. If you return from the ISR without clearing the bit, the interrupt controller operates as if another interrupt request came in from the same source. In other words, if a specific bit of the SRCPND register is set to 1, it is always considered as a valid interrupt request waiting to be serviced.

The time to clear the corresponding bit depends on the user's requirement. If you want to receive another valid request from the same source, you should clear the corresponding bit first, and then enable the interrupt.

You can clear a specific bit of the SRCPND register by writing a data to this register. It clears only the bit positions of the SRCPND corresponding to those set to one in the data. The bit positions corresponding to those that are set to 0 in the data remains as they are.

**SOURCE PENDING (SRCPND 1) REGISTER FOR GROUP 1**

| Register | Address    | R/W | Description  | Reset Value |
|----------|------------|-----|--|-------------|
| SRCPND 1 | 0X4A000000 | R/W | Indicate the interrupt request status for group 1.<br>0 = The interrupt has not been requested.<br>1 = The interrupt source has asserted the interrupt request.  | 0x00000000  |
| SRCPND 2 | 0X4A000040 | R/W | Indicate the interrupt request status for group 2..<br>0 = The interrupt has not been requested.<br>1 = The interrupt source has asserted the interrupt request. | 0x00000000  |

| SRCPND 1  | Bit  | Description                      | Initial State |
|-----------|------|----------------------------------|---------------|

**2.2 INTERRUPT MODE (INTMOD) REGISTER**

This register is composed of 32 bits each of which is related to an interrupt source. If a specific bit is set to 1, the corresponding interrupt is processed in the FIQ (fast interrupt) mode. Otherwise, it is processed in the IRQ mode (normal interrupt).

Note that only one interrupt source can be serviced in the FIQ mode in the interrupt controller (you should use the FIQ mode only for the urgent interrupt). Thus, only one bit of INTMOD can be set to 1.

| Register | Address    | R/W | Description   | Reset Value |
|----------|------------|-----|---|-------------|
| INTMOD 1 | 0X4A000004 | R/W | Interrupt mode regiseter for group 1.<br>0 = IRQ mode<br>1 = FIQ mode | 0x00000000  |
| INTMOD 2 | 0X4A000044 | R/W | Interrupt mode regiseter for group 2.<br>0 = IRQ mode<br>1 = FIQ mode | 0x00000000  |

**NOTE:** If an interrupt mode is set to FIQ mode in the INTMOD register, FIQ interrupt will not affect both INT\_PND and INT\_OFFSET registers. In this case, the two registers are valid only for IRQ mode interrupt source.

| INTMOD1    | Bit  | Description      | Initial State |
|------------|------|------------------|---------------|
| INT_ADC    | [31] | 0 = IRQ, 1 = FIQ | 0             |
| INT_RTC    | [30] | 0 = IRQ, 1 = FIQ | 0             |
| INT_SPI1   | [29] | 0 = IRQ, 1 = FIQ | 0             |
| INT_UART0  | [28] | 0 = IRQ, 1 = FIQ | 0             |
| INT_IIC0   | [27] | 0 = IRQ, 1 = FIQ | 0             |
| INT_USBH   | [26] | 0 = IRQ, 1 = FIQ | 0             |
| INT_USBD   | [25] | 0 = IRQ, 1 = FIQ | 0             |
| INT_NAND   | [24] | 0 = IRQ, 1 = FIQ | 0             |
| INT_UART1  | [23] | 0 = IRQ, 1 = FIQ | 0             |
| INT_SPI0   | [22] | 0 = IRQ, 1 = FIQ | 0             |
| INT_SDI0   | [21] | 0 = IRQ, 1 = FIQ | 0             |
| INT_SDI1   | [20] | 0 = IRQ, 1 = FIQ | 0             |
| INT_CFCON  | [19] | 0 = IRQ, 1 = FIQ | 0             |
| INT_UART3  | [18] | 0 = IRQ, 1 = FIQ | 0             |
| INT_DMA    | [17] | 0 = IRQ, 1 = FIQ | 0             |
| INT_LCD    | [16] | 0 = IRQ, 1 = FIQ | 0             |
| INT_UART2  | [15] | 0 = IRQ, 1 = FIQ | 0             |
| INT_TIMER4 | [14] | 0 = IRQ, 1 = FIQ | 0             |
| INT_TIMER3 | [13] | 0 = IRQ, 1 = FIQ | 0             |
| INT_TIMER2 | [12] | 0 = IRQ, 1 = FIQ | 0             |
| INT_TIMER1 | [11] | 0 = IRQ, 1 = FIQ | 0             |
| INT_TIMER0 | [10] | 0 = IRQ, 1 = FIQ | 0             |

| INTMOD1      | Bit | Description      | Initial State |
|--------------|-----|------------------|---------------|
| INT_WDT/AC97 | [9] | 0 = IRQ, 1 = FIQ | 0             |
| INT_TICK     | [8] | 0 = IRQ, 1 = FIQ | 0             |
| nBATT_FLT    | [7] | 0 = IRQ, 1 = FIQ | 0             |
| INT_CAM      | [6] | 0 = IRQ, 1 = FIQ | 0             |
| EINT8_23     | [5] | 0 = IRQ, 1 = FIQ | 0             |
| EINT4_7      | [4] | 0 = IRQ, 1 = FIQ | 0             |
| EINT3        | [3] | 0 = IRQ, 1 = FIQ | 0             |
| EINT2        | [2] | 0 = IRQ, 1 = FIQ | 0             |
| EINT1        | [1] | 0 = IRQ, 1 = FIQ | 0             |
| EINT0        | [0] | 0 = IRQ, 1 = FIQ | 0             |
| INTMOD2      | Bit | Description      | Initial State |
| INT_I2S1     | [7] | 0 = IRQ, 1 = FIQ | 0             |
| INT_I2S0     | [6] | 0 = IRQ, 1 = FIQ | 0             |
| INT_PCM1     | [5] | 0 = IRQ, 1 = FIQ | 0             |
| INT_PCM0     | [4] | 0 = IRQ, 1 = FIQ | 0             |
| Reserved     | [3] | 0 = IRQ, 1 = FIQ | 0             |
| Reserved     | [2] | 0 = IRQ, 1 = FIQ | 0             |
| INT_IIC1     | [1] | 0 = IRQ, 1 = FIQ | 0             |
| INT_2D       | [0] | 0 = IRQ, 1 = FIQ | 0             |

**2.3 INTERRUPT MASK (INTMSK) REGISTER**

This register also has 32 bits each of which is related to an interrupt source. If a specific bit is set to 1, the CPU does not service the interrupt request from the corresponding interrupt source (note that even in such a case, the corresponding bit of SRCPND register is set to 1). If the mask bit is 0, the interrupt request can be serviced.

| Register | Address    | R/W | Description   | Reset Value |
|----------|------------|-----|---|-------------|
| INTMSK1  | 0X4A000008 | R/W | Determine which interrupt source of group 1 is masked. The masked interrupt source will not be serviced.<br>0 = Interrupt service is available.<br>1 = Interrupt service is masked. | 0xFFFFFFFF  |
| INTMSK2  | 0X4A000048 | R/W | Determine which interrupt source of group 2 is masked. The masked interrupt source will not be serviced.<br>0 = Interrupt service is available.<br>1 = Interrupt service is masked. | 0xFFFFFFFF  |

| INTMSK1      | Bit  | Description                       | Initial State |
|--------------|------|-----------------------------------|---------------|
| INT_ADC      | [31] | 0 = Service available, 1 = Masked | 1             |
| INT_RTC      | [30] | 0 = Service available, 1 = Masked | 1             |
| INT_SPI1     | [29] | 0 = Service available, 1 = Masked | 1             |
| INT_UART0    | [28] | 0 = Service available, 1 = Masked | 1             |
| INT_IIC0     | [27] | 0 = Service available, 1 = Masked | 1             |
| INT_USBH     | [26] | 0 = Service available, 1 = Masked | 1             |
| INT_USBD     | [25] | 0 = Service available, 1 = Masked | 1             |
| INT_NAND     | [24] | 0 = Service available, 1 = Masked | 1             |
| INT_UART1    | [23] | 0 = Service available, 1 = Masked | 1             |
| INT_SPI0     | [22] | 0 = Service available, 1 = Masked | 1             |
| INT_SDI0     | [21] | 0 = Service available, 1 = Masked | 1             |
| INT_SDI1     | [20] | 0 = Service available, 1 = Masked | 1             |
| INT_CFCON    | [19] | 0 = Service available, 1 = Masked | 1             |
| INT_UART3    | [18] | 0 = Service available, 1 = Masked | 1             |
| INT_DMA      | [17] | 0 = Service available, 1 = Masked | 1             |
| INT_LCD      | [16] | 0 = Service available, 1 = Masked | 1             |
| INT_UART2    | [15] | 0 = Service available, 1 = Masked | 1             |
| INT_TIMER4   | [14] | 0 = Service available, 1 = Masked | 1             |
| INT_TIMER3   | [13] | 0 = Service available, 1 = Masked | 1             |
| INT_TIMER2   | [12] | 0 = Service available, 1 = Masked | 1             |
| INT_TIMER1   | [11] | 0 = Service available, 1 = Masked | 1             |
| INT_TIMER0   | [10] | 0 = Service available, 1 = Masked | 1             |

**2.4 INTERRUPT PENDING (INTPND) REGISTER**

Each of the 32 bits in the interrupt pending register shows whether the corresponding interrupt request, which is unmasked and waits for the interrupt to be serviced, has the highest priority. Since the INTPND register is located after the priority logic, only one bit can be set to 1, and that interrupt request generates IRQ to CPU. In interrupt service routine for IRQ, you can read this register to determine which interrupt source is serviced among the 32 sources.

Like the SRCPND register, this register has to be cleared in the interrupt service routine after clearing the SRCPND register. We can clear a specific bit of the INTPND register by writing a data to this register. It clears only the bit positions of the INTPND register corresponding to those set to one in the data. The bit positions corresponding to those that are set to 0 in the data remains as they are.

| Register | Address    | R/W | Description   | Reset Value |
|----------|------------|-----|---|-------------|
| INTPND1  | 0X4A000010 | R/W | Indicate the interrupt request status for group 1.<br>0 = The interrupt has not been requested.<br>1 = The interrupt source has asserted the interrupt request. | 0x00000000  |
| INTPND2  | 0X4A000050 | R/W | Indicate the interrupt request status for group 2.<br>0 = The interrupt has not been requested.<br>1 = The interrupt source has asserted the interrupt request. | 0x00000000  |

**NOTES:**

1. If the FIQ mode interrupt occurs, the corresponding bit of INTPND will not be turned on as the INTPND register is available only for IRQ mode interrupt.
2. Cautions in clearing the INTPND register. The INTPND register is cleared to "0" by writing "1". If the INTPND bit, which has "1", is cleared by "0", the INTPND register & INTOFFSET register may have unexpected value in some case. So, you never write "0" on the INTPND bit having "1". The convenient method to clear the INTPND register is writing the INTPND register value on the INTPND register. (In even our example code, this guide hasn't been applied yet.)

| INTPND1   | Bit  | Description                      | Initial State |
|-----------|------|----------------------------------|---------------|
| INT_ADC   | [31] | 0 = Not requested, 1 = Requested | 0             |
| INT_RTC   | [30] | 0 = Not requested, 1 = Requested | 0             |
| INT_SPI1  | [29] | 0 = Not requested, 1 = Requested | 0             |
| INT_UART0 | [28] | 0 = Not requested, 1 = Requested | 0             |
| INT_IIC0  | [27] | 0 = Not requested, 1 = Requested | 0             |
| INT_USBH  | [26] | 0 = Not requested, 1 = Requested | 0             |

**2.5 INTERRUPT OFFSET (INTOFFSET) REGISTER**

The value in the interrupt offset register shows, which interrupt request of IRQ mode is in the INTPND register. This bit can be cleared automatically by clearing SRCPND and INTPND.

| Register   | Address    | R/W | Description   | Reset Value |
|------------|------------|-----|---|-------------|
| INTOFFSET1 | 0X4A000014 | R   | Indicate the IRQ interrupt request source for group 1 | 0x00000000  |
| INTOFFSET2 | 0X4A000054 | R   | Indicate the IRQ interrupt request source for group 2 | 0x00000000  |

| INT Source for group 1 | The OFFSET Value | INT Source for group 1 | The OFFSET Value |
|------------------------|------------------|------------------------|------------------|
| INT_ADC                | 31               | INT_UART2              | 15               |
| INT_RTC                | 30               | INT_TIMER4             | 14               |
| INT_SPI1               | 29               | INT_TIMER3             | 13               |
| INT_UART0              | 28               | INT_TIMER2             | 12               |
| INT_IIC0               | 27               | INT_TIMER1             | 11               |
| INT_USBH               | 26               | INT_TIMER0             | 10               |
| INT_USBD               | 25               | INT_WDT/AC97           | 9                |
| INT_NAND               | 24               | INT_TICK               | 8                |
| INT_UART1              | 23               | nBATT_FLT              | 7                |
| INT_SPI0               | 22               | INT_CAM                | 6                |
| INT_SDI0               | 21               | EINT8_23               | 5                |
| INT_SDI1               | 20               | EINT4_7                | 4                |

**NOTE:** FIQ mode interrupt does not affect the INTOFFSET register as the register is available only for IRQ mode interrupt.

**2.6 SUB SOURCE PENDING (SUBSRCPND) REGISTER**

You can clear a specific bit of the SUBSRCPND register by writing a data to this register. It clears only the bit positions of the SUBSRCPND register corresponding to those set to one in the data. The bit positions corresponding to those that are set to 0 in the data remains as they are.

| Register  | Address    | R/W | Description   | Reset Value |
|-----------|------------|-----|---|-------------|
| SUBSRCPND | 0X4A000018 | R/W | Indicate the interrupt request status.<br>0 = The interrupt has not been requested.<br>1 = The interrupt source has asserted the interrupt request. | 0x00000000  |

| SUBSRCPND               | Bit  | Description                      | SRCPND       | Initial State |

**2.7 INTERRUPT SUB MASK (INTSUBMSK) REGISTER**

This register has 27 bits each of which is related to an interrupt source. If a specific bit is set to 1, the interrupt request from the corresponding interrupt source is not serviced by the CPU (note that even in such a case, the corresponding bit of the SUBSRCPND register is set to 1). If the mask bit is 0, the interrupt request can be serviced.

| Register  | Address    | R/W | Description   | Reset Value |
|-----------|------------|-----|---|-------------|
| INTSUBMSK | 0X4A00001C | R/W | Determine which interrupt source is masked.<br>The masked interrupt source will not be serviced.<br><br>0 = Interrupt service is available.<br>1 = Interrupt service is masked. | 0xFFFFFFFF  |

# 11

## I/O PORTS

### 1 OVERVIEW

S3C2451 has 174 multi-functional input/output port pins and there are 12 ports as shown below:

- Port A(GPA) : 27-output port
- Port B(GPB) : 11-input/output port
- Port C(GPC) : 16-input/output port
- Port D(GPD) : 16-input/output port
- Port E(GPE) : 16-input/output port
- Port F(GPF) : 8-input/output port
- Port G(GPG) : 16-input/output port
- Port H(GPH) : 15-input/output port
- Port J(GPJ) : 16-input/output port
- Port K(GPK) : 16-input/output port
- Port L(GPL) : 15-input/output port
- Port M(GPM) : 2-input port

Each port can be easily configured by software to meet various system configurations and design requirements. You have to define which function of each pin is used before starting the main program. If a pin is not used for multiplexed functions, the pin can be configured as I/O ports.

Table 11-1. S3C2451 Port Configuration (Sheet 1)

| Port A | Selectable Pin Functions |         |   |   |
|--------|--------------------------|---------|---|---|
| GPA27  | Output only              | nWE_CF  | – | – |
| GPA26  | Output only              | DQM3    | – | – |
| GPA25  | Output only              | DQM2    | – | – |
| GPA24  | Output only              | RSMAVD  | – | – |
| GPA23  | Output only              | RSMCLK  | – | – |
| GPA22  | Output only              | nFCE    | – | – |
| GPA21  | Output only              | nRSTOUT | – | – |
| GPA20  | Output only              | nFRE    | – | – |
| GPA19  | Output only              | nFWE    | – | – |
| GPA18  | Output only              | ALE     | – | – |
| GPA17  | Output only              | CLE     | – | – |
| GPA16  | Output only              | nRCS5   | – | – |
| GPA15  | Output only              | nRCS4   | – | – |
| GPA14  | Output only              | nRCS3   | – | – |
| GPA13  | Output only              | nRCS2   | – | – |
| GPA12  | Output only              | nRCS1   | – | – |
| GPA11  | Output only              | nOE_CF  | – | – |
| GPA10  | Reserved                 | RADDR25 | – | – |
| GPA9   | Output only              | RADDR24 | – | – |
| GPA8   | Output only              | RADDR23 | – | – |
| GPA7   | Output only              | RADDR22 | – | – |
| GPA6   | Output only              | RADDR21 | – | – |
| GPA5   | Output only              | RADDR20 | – | – |
| GPA4   | Output only              | RADDR19 | – | – |
| GPA3   | Output only              | RADDR18 | – | – |
| GPA2   | Output only              | RADDR17 | – | – |
| GPA1   | Output only              | RADDR16 | – | – |
| GPA0   | Output only              | RADDR0  | – | – |

Table 11-1. S3C2451 Port Configuration (Sheet 2) (Continued)

| Port B | Selectable Pin Functions |         |        |          |
|--------|--------------------------|---------|--------|----------|
| GPB10  | Input/output             | nXDREQ0 | XDREQ0 | I2SSDO_2 |
| GPB9   | Input/output             | nXDACK0 | XDACK0 | I2SSDO_1 |
| GPB8   | Input/output             | nXDREQ1 | XDREQ1 | I2CSCL   |
| GPB7   | Input/output             | nXDACK1 | XDACK1 | I2CSDA   |
| GPB6   | Input/output             | nXBREQ  | XBREQ  | RTCK     |
| GPB5   | Input/output             | nXBACK  | XBACK  | –        |
| GPB4   | Input/output             | TCLK    | –      | –        |
| GPB3   | Input/output             | TOUT3   | –      | –        |
| GPB2   | Input/output             | TOUT2   | –      | –        |
| GPB1   | Input/output             | TOUT1   | –      | –        |
| GPB0   | Input/output             | TOUT0   | –      | –        |

| Port C | Selectable Pin Functions |                       |   |   |
|--------|--------------------------|-----------------------|---|---|

| GPM0   | Input                    | RSMBWAIT | – | – |

## 2 PORT CONTROL DESCRIPTIONS

### 2.1 PORT CONFIGURATION REGISTER (GPACON-GPMCON)

In S3C2451, most of the pins are multiplexed pins. So, It is determined which function is selected for each pins. The GPxCON(port control register) determines which function is used for each pin.

If GPF0 – GPF7, GPG0 – GPG7 is used for the wakeup signal in Sleep/Stop/DeepStop mode, these ports must be configured in EINT.

### 2.2 PORT DATA REGISTER (GPADAT-GPMDAT)

If ports are configured as output ports, data can be written to the corresponding bit of GPxDAT. If Ports are configured as input ports, the data can be read from the corresponding bit of GPxDAT.

### 2.3 PORT PULL-UP/DOWN REGISTER (GPBUDP-GPMUDP)

The port pull-up/down register controls the pull-up/down resistor enable/disable of each port group. When the corresponding bit is 0, the pull-down resistor of the pin is enabled. When 1, the pull-down resistor is disabled.

If the port pull-down resistor is enabled then the pull-down resistors work without pin's functional setting(input, output, DATAn, EINTn and etc)

### 2.4 MISCELLANEOUS CONTROL REGISTER

This register controls mode selection, and CLKOUT selection.

### 2.5 EXTERNAL INTERRUPT CONTROL REGISTER

The 24 external interrupts are requested by various signaling methods. The EXTINT register configures the signaling method among the low level trigger, high level trigger, falling edge trigger, rising edge trigger, and both edge trigger for the external interrupt request

Because each external interrupt pin has a digital filter, the interrupt controller can recognize the request signal that is longer than 3 clocks.

EINT[15:0] are used for wakeup sources from Sleep/Stop/DeepStop mode.

#### Caution

I/O ports in VDD\_SD power domain release retention automatically when I/O ports are waken up from sleep mode. In Stop/DeepStop/Sleep mode GPA/GPK status are controlled by PDSMCON/PDDMCON. They control GPA/GPK as a few groups. For example like GPA1 and GPA2 individual control is impossible in sleep mode.

### 3 I/O PORT CONTROL REGISTER

#### 3.1 PORT A CONTROL REGISTERS (GPACON, GPADAT)

| Register | Address    | R/W | Description                   | Reset Value |
|----------|------------|-----|-------------------------------|-------------|
| GPACON   | 0x56000000 | R/W | Configures the pins of port A | 0x0ffffff   |
| GPADAT   | 0x56000004 | R/W | The data register for port A  | 0x0         |
| Reserved | 0x56000008 | –   | –                             | –           |
| Reserved | 0x5600000c | –   | –                             | –           |

| GPACON   | Bit     | Description  |             |
|----------|---------|--------------|-------------|
| Reserved | [31:28] | Reserved     |             |
| GPA27    | [27]    | 0 = Output   | 1 = nWE_CF  |
| GPA26    | [26]    | 0 = Output   | 1 = DQM3    |

### 3.13 MISCELLANEOUS CONTROL REGISTER (MISCCR)

In Sleep mode, the data bus(SD[15:0] or RD[15:0]) can be set as Hi-Z and Output '0' state. But, because of the characteristics of IO pad, the data bus pull-up/down resistors have to be turned on or off to reduce the power consumption. SD[15:0] or RD[15:0] pin pull-up/down resistors can be controlled by MISCCR register.

Pads related USB are controlled by this register for USB host, or for USB device.

| Register | Address    | R/W | Description                    | Reset Value |

| DCLK0CMP   | [11:8]  | DCLK0 compare value clock toggle value. ( $< \text{DCLK0DIV}$ )<br>If the DCLK0CMP is $n$ , Low level duration is $(n + 1)$ ,<br>High level duration is $((\text{DCLK0DIV} + 1) - (n + 1))$ |
| DCLK0DIV   | [7:4]   | DCLK0 divide value.<br>$\text{DCLK0 frequency} = \text{source clock} / (\text{DCLK0DIV} + 1)$   |
| DCLK0SelCK | [1]     | Select DCLK0 source clock<br>0 = PCLK<br>1 = EPLL   |
| DCLK0EN    | [0]     | DCLK0 enable<br>0 = DCLK0 disable<br>1 = DCLK0 enable   |

### 3.15 EXTINTn (External Interrupt Control Register n)

The 8 external interrupts can be requested by various Signalling methods. The EXTINT register configures the Signalling method between the level trigger and edge trigger for the external interrupt request, and also configures the signal polarity.

To recognize the level interrupt, the valid logic level on EXTINTn pin must be retained for 40ns at least because of the noise filter.

| Register | Address    | R/W | Description                           | Reset Value |
|----------|------------|-----|---------------------------------------|-------------|
| EXTINT0  | 0x56000088 | R/W | External interrupt control register 0 | 0x0         |
| EXTINT1  | 0x5600008c | R/W | External interrupt control register 1 | 0x0         |
| EXTINT2  | 0x56000090 | R/W | External interrupt control register 2 | 0x0         |

**NOTES**

# 12 WATCHDOG TIMER

## 1 OVERVIEW

The S3C2451 watchdog timer is used to resume the controller operation whenever it is disturbed by malfunctions such as noise and system errors. The watchdog timer generates the reset signal. It can be used as a normal 16-bit interval timer to request interrupt service.

Advantage in using WDT instead of PWM timer is that WDT generates the reset signal.

### 1.1 FEATURES

The Watchdog Timer includes the following features:

- Normal interval timer mode with interrupt request
- Internal reset signal is activated for 128 PCLK cycles when the timer count value reaches 0 (time-out).

## 2 WATCHDOG TIMER OPERATION

### 2.1 BLOCK DIAGRAM

Figure 12-1 shows the functional block diagram of the watchdog timer. The watchdog timer uses only PCLK as its source clock. The PCLK frequency is prescaled to generate the corresponding watchdog timer clock, and the resulting frequency is divided again.

Figure 12-1. Watchdog Timer Block Diagram

The prescaler value and the frequency division factor are specified in the watchdog timer control (WTCON) register. Valid prescaler values range from 0 to 28-1. The frequency division factor can be selected as 16, 32, 64, or 128.

Use the following equation to calculate the watchdog timer clock frequency and the duration of each timer clock cycle:

$$t_{\text{watchdog}} = 1 / [ \text{PCLK} / (\text{Prescaler value} + 1) / \text{Division\_factor} ]$$

### 2.2 WTDAT & WTCNT

Watchdog Timer operation based on the value of watchdog timer count (WTCNT) register. Once timer is operated, count value will be down counting from the initial value of WTCNT register. During the watchdog timer operation, it contains the current count values.

The value of WTDAT register will be automatically reloaded into WTCNT at every time-out, if watchdog timer is used for the normal timer.

#### NOTE

At initial watchdog timer operation(of enable), the value of watchdog timer data (WTDAT) register is not automatically loaded into the timer counter (WTCNT). An initial value MUST be written to the watchdog timer count (WTCNT) register, before the watchdog timer starts.

### 2.3 CONSIDERATION OF DEBUGGING ENVIRONMENT

When the S3C2451 is in debug mode using Embedded ICE, the watchdog timer must not operate.

The watchdog timer can determine whether or not it is currently in the debug mode from the CPU core signal (DBGACK signal). Once the DBGACK signal in CPU core is asserted, the reset output of the watchdog timer is not activated as the watchdog timer is expired.

### 3 WATCHDOG TIMER SPECIAL REGISTERS

#### 3.1 WATCHDOG TIMER CONTROL (WTCN) REGISTER

The WTCN register allows the user to enable/disable the watchdog timer, select the clock signal from 4 different sources, enable/disable interrupts, and enable/disable the watchdog timer output.

The Watchdog timer is used to resume the S3C2451 restart on malfunction after its power on. At this time, disable the interrupt generation and enable the Watchdog timer output for reset signal.

If controller restart is not desired and if the user wants to use the normal timer only, which is provided by the Watchdog timer, enable the interrupt generation and disable the Watchdog timer output for reset signal.

| Register | Address    | R/W | Description                     | Reset Value |
|----------|------------|-----|---------------------------------|-------------|
| WTCN     | 0x53000000 | R/W | Watchdog timer control register | 0x8021      |

| WTCN                 | Bit    | Description  | Initial State |
|----------------------|--------|--|---------------|
| Prescaler value      | [15:8] | Prescaler value.<br>The valid range is from 0 to 255(28-1).  | 0x80          |
| Reserved             | [7:6]  | Reserved.<br>These two bits must be 00 in normal operation.  | 00            |
| Watchdog timer       | [5]    | Enable or disable bit of Watchdog timer.<br>0 = Disable<br>1 = Enable  | 1             |
| Clock select         | [4:3]  | Determine the clock division factor.<br>00 = 16<br>01 = 32<br>10 = 64<br>11 = 128  | 00            |
| Interrupt generation | [2]    | Enable or disable bit of the interrupt.<br>0 = Disable<br>1 = Enable   | 0             |
| Reserved             | [1]    | Reserved.<br>This bit must be 0 in normal operation.   | 0             |
| Reset enable/disable | [0]    | Enable or disable bit of Watchdog timer output for reset signal.<br>1 = Assert reset signal of the S3C2451 at watchdog time-out<br>0 = Disable the reset function of the watchdog timer. | 1             |

**NOTE:** Initial state of 'Reset enable/disable' is 1(reset enable). If user do not disable this bit, S3C2451 will be rebooted in about 5.63sec (In the case of PCLK is 12MHz). So at boot loader, this bit should be disabled before under control of Operating System, or Firmware.

### 3.2 WATCHDOG TIMER DATA (WTDAT) REGISTER

The WTDAT register is used to specify the time-out duration. The content of WTDAT cannot be automatically loaded into the timer counter at initial watchdog timer operation. However, using 0x8000 (initial value) will drive the first time-out. In this case, the value of WTDAT will be automatically reloaded into WTCNT.

| Register | Address    | R/W | Description                  | Reset Value |
|----------|------------|-----|------------------------------|-------------|
| WTDAT    | 0x53000004 | R/W | Watchdog timer data register | 0x8000      |

| WTDAT              | Bit    | Description                            | Initial State |
|--------------------|--------|--|---------------|
| Count reload value | [15:0] | Watchdog timer count value for reload. | 0x8000        |

### 3.3 WATCHDOG TIMER COUNT (WTCNT) REGISTER

The WTCNT register contains the current count values for the watchdog timer during normal operation.

Note that the content of the WTDAT register cannot be automatically loaded into the timer count register when the watchdog timer is enabled initially, so the WTCNT register must be set to an initial value before enabling it.

| Register | Address    | R/W | Description                   | Reset Value |
|----------|------------|-----|-------------------------------|-------------|
| WTCNT    | 0x53000008 | R/W | Watchdog timer count register | 0x8000      |

| WTCNT       | Bit    | Description                                   | Initial State |
|-------------|--------|---|---------------|
| Count value | [15:0] | The current count value of the watchdog timer | 0x8000        |

## NOTES

# 13

## PWM TIMER

### 1 OVERVIEW

The S3C2451 has five 16-bit timers. Timer 0, 1, 2, and 3 have Pulse Width Modulation (PWM) function. Timer 4 has an internal timer only with no output pins. The timer 0 has a dead-zone generator, which is used with a large current device.

The timer 0 and 1 share an 8-bit prescaler, while the timer 2, 3 and 4 share other 8-bit prescaler. Each timer has a clock divider, which generates 5 different divided signals (1/2, 1/4, 1/8, 1/16, and TCLK). Each timer block receives its own clock signals from the clock divider, which receives the clock from the corresponding 8-bit prescaler. The 8-bit prescaler is programmable and divides the PCLK according to the loading value, which is stored in TCFG0 and TCFG1 registers.

The timer count buffer register (TCNTBn) has an initial value, which is loaded into the internal down-counter when the timer is enabled. The timer compare buffer register (TCMPBn) has an initial value, which is loaded into the internal compare register to be compared with the internal down-counter value. This double buffering feature of TCNTBn and TCMPBn makes the timer generate a stable output when the frequency and duty ratio are changed.

Each timer has its own 16-bit internal down counter, which is driven by the timer clock. When the internal down-counter reaches zero, the timer interrupt request is generated to inform the CPU that the timer operation has been completed. When the timer internal down-counter reaches zero, the value of corresponding TCNTBn is automatically loaded into the internal down-counter to continue the next operation. However, if the timer stops, for example, by clearing the timer enable bit of TCONn during the timer running mode, the value of TCNTBn will not be reloaded into the internal down-counter.

The value of TCMPBn is used for pulse width modulation (PWM). The timer control logic changes the output level when the internal down-counter value matches the value of the internal compare register in the timer control logic. Therefore, the internal compare register determines the turn-on time (or turn-off time) of a PWM output.

#### 1.1 FEATURE

- Five 16-bit timers
- Two 8-bit prescalers & Two 4-bit divider
- Programmable duty control of output waveform (PWM)
- Auto reload mode or one-shot pulse mode
- Dead-zone generator

Figure 13-1. 16-bit PWM Timer Block Diagram

## 2 PWM TIMER OPERATION

### 2.1 PRESCALER & DIVIDER

An 8-bit prescaler and a 4-bit divider make the following output frequencies:

| 4-bit Divider Settings | Minimum Resolution (prescaler = 0) | Maximum Resolution (prescaler = 255) | Min. Interval (TCNTBn = 1) | Max. Interval (TCNTBn = 65535) |
|------------------------|------------------------------------|--------------------------------------|----------------------------|--------------------------------|
| 1/2 (PCLK = 50 MHz)    | 0.0400 us (25.000 MHz)             | 10.2400 us (97.6562 kHz)             | 0.0800 us                  | 0.6710 sec                     |
| 1/4 (PCLK = 50 MHz)    | 0.0800 us (12.500 MHz)             | 20.4800 us (48.8281 kHz)             | 0.1600 us                  | 1.3421 sec                     |
| 1/8 (PCLK = 50 MHz)    | 0.1600 us ( 6.250 MHz)             | 40.9601 us (24.4140 kHz)             | 0.3200 us                  | 2.6843 sec                     |
| 1/16 (PCLK = 50 MHz)   | 0.3200 us ( 3.125 MHz)             | 81.9188 us (12.2070 kHz)             | 0.6400 us                  | 5.3686 sec                     |

## 2.2 BASIC TIMER OPERATION

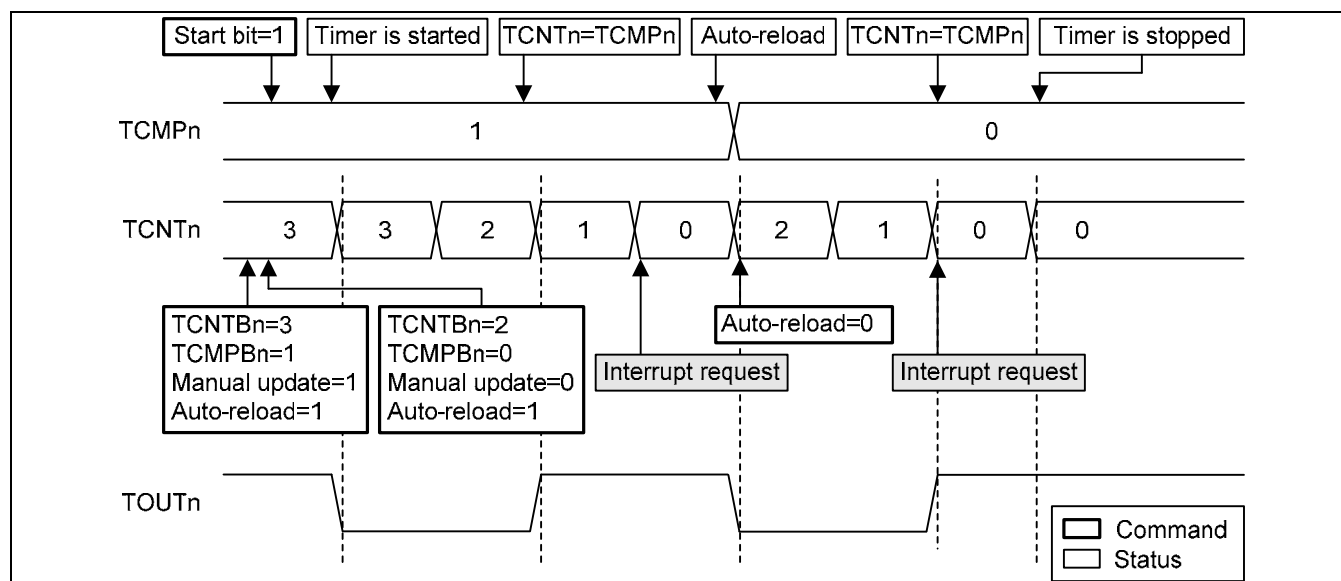

Figure 13-2. Timer Operations

A timer (except the timer ch-4) has TCNTBn, TCNTn, TCMPBn and TCMPn. The TCNTBn and the TCMPBn are loaded into the TCNTn and the TCMPn when the timer reaches 0.

When the TCNTn reaches 0, an interrupt request will occur if the interrupt is enabled.

## NOTE

TCNTn and TCMPn are the names of the internal registers. (16bit Internal down-counter (register) and 16bit internal compare register, respectively.) The TCNTn register can be read from the TCNTOn register

If you want to generate interrupt at intervals 3cycle of TOUTn, set TCNTBn, TCMPBn and TCON register like Figure 13-2. That is :

- i) Set TCNTBn=3 and TCMPBn=1.
- ii) Set auto-reload=1 and manual update=1.  
When manual update bit is 1, TCNTBn and TCMPBn value are loaded to TCNTn and TCMPn.
- iii) Set TCNTBn=2 and TCMPBn=0 for next operation.
- iv) Set auto-reload=1 and manual update=0.  
If you set manual update=1 at this time, TCNTn is changed to 2 and TCMP is changed to 0.  
So, interrupt is generated at interval 2cycle instead of 3cycle.  
You must set auto-reload=1 automatically for next operation.
- v) Set start = 1 for operation start and then TCNTn is down counting.  
When TCNTn is 0, interrupt is generated and If auto-reload is enable, TCNTn is loaded 2 (TCNTBn value) and TCMPn is loaded 0(TCMPn value).
- vi) Before stop, TCNTn is down counting.

### 2.3 AUTO RELOAD & DOUBLE BUFFERING

S3C2451 PWM Timers have a double buffering function, enabling the reload value changed for the next timer operation without stopping the current timer operation. So, although the new timer value is set, a current timer operation is completed successfully.

The timer value can be written into Timer Count Buffer register (TCNTBn) and the current counter value of the timer can be read from Timer Count Observation register (TCNTOn). If the TCNTBn is read, the read value does not indicate the current state of the counter but the reload value for the next timer duration.

The auto-reload operation copies the TCNTBn into TCNTn when the TCNTn reaches 0. The value, written into the TCNTBn, is loaded to the TCNTn only when the TCNTn reaches 0 and auto reload is enabled. If the TCNTn becomes 0 and the auto reload bit is 0, the TCNTn does not operate any further.

Figure 13-3. Example of Double Buffering Function

## 2.4 TIMER INITIALIZATION USING MANUAL UPDATE BIT AND INVERTER BIT

An auto reload operation of the timer occurs when the internal down-counter(TCNTn) reaches 0. So, a starting value of the TCNTn has to be defined by the user in advance. In this case, the starting value has to be loaded by the manual update bit. The following steps describe how to start a timer:

1. Write the initial value into TCNTBn and TCMPBn.
2. Set the manual update bit of the corresponding timer. It is recommended that you configure the inverter on/off bit. (Whether use inverter or not).
3. Set start bit of the corresponding timer to start the timer (and clear the manual update bit, configure the inverter on/off bit as you want).

If the timer is stopped by force, the TCNTn retains the counter value and is not reloaded from TCNTBn. If a new value has to be set, perform manual update.

### NOTE

Whenever TOUT inverter on/off bit is changed, the TOUTn logic value will also be changed whether the timer runs. Therefore, it is desirable that the inverter on/off bit is configured with the manual update bit.

## 2.5 TIMER OPERATION

**Figure 13-4. Example of a Timer Operation**

The above Figure 13-4 shows the result of the following procedure:

1. Enable the auto re-load function. Set the TCNTBn to 160 (50+110) and the TCMPBn to 110. Set the manual update bit and configure the inverter bit (on/off). The manual update bit sets TCNTn and TCMPn to the values of TCNTBn and TCMPBn, respectively.  
And then, set the TCNTBn and the TCMPBn to 80 (40+40) and 40, respectively, to determine the next reload value.
2. Set the start bit, provided that manual\_update is 0 and the inverter is off and auto reload is on. The timer starts counting down after latency time within the timer resolution.
3. When the TCNTn has the same value as that of the TCMPn, the logic level of the TOUTn is changed from low to high.
4. When the TCNTn reaches 0, the interrupt request is generated and TCNTBn value is loaded into a temporary register. At the next timer tick, the TCNTn is reloaded with the temporary register value (TCNTBn).
5. In Interrupt Service Routine (ISR), the TCNTBn and the TCMPBn are set to 80 (20+60) and 60, respectively, for the next duration.
6. When the TCNTn has the same value as the TCMPn, the logic level of TOUTn is changed from low to high.
7. When the TCNTn reaches 0, the TCNTn is reloaded automatically with the TCNTBn, triggering an interrupt request.
8. In Interrupt Service Routine (ISR), auto reload and interrupt request are disabled to stop the timer.
9. When the value of the TCNTn is same as the TCMPn, the logic level of the TOUTn is changed from low to high.
10. Even when the TCNTn reaches 0, the TCNTn is not any more reloaded and the timer is stopped because auto reload has been disabled.
11. No more interrupt requests are generated.

2.6 PULSE WIDTH MODULATION (PWM)

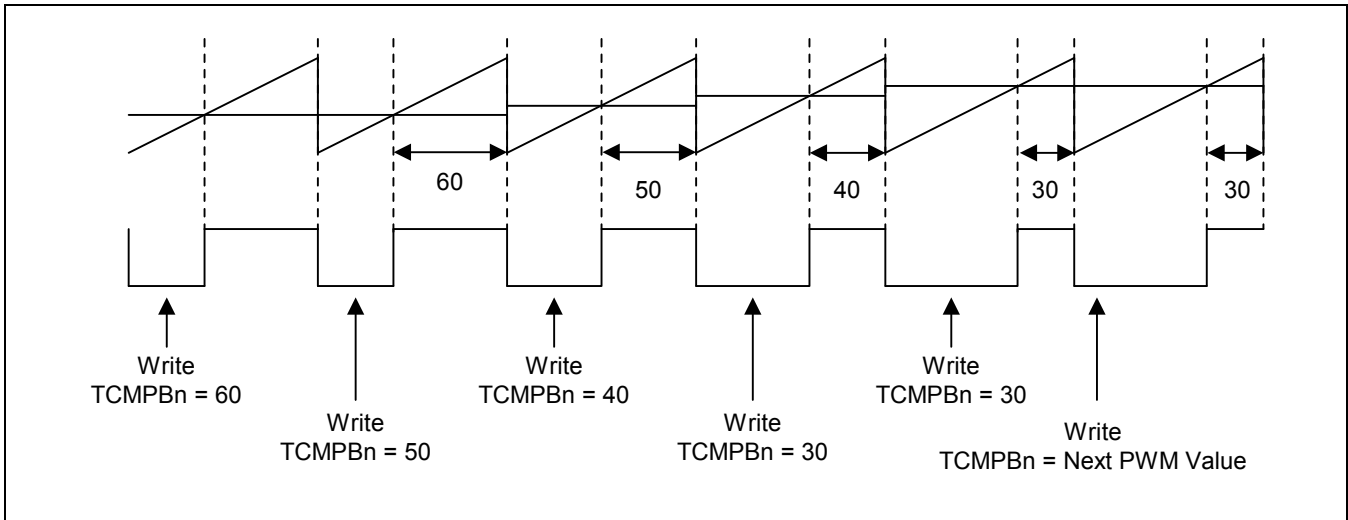

Figure 13-5. Example of PWM

PWM function can be implemented by using the TCMPBn. PWM frequency is determined by TCNTBn. Figure 13-5 shows a PWM value determined by TCMPBn.

For a higher PWM value, decrease the TCMPBn value. For a lower PWM value, increase the TCMPBn value. If an output inverter is enabled, the increment/decrement may be reversed.

The double buffering function allows the TCMPBn, for the next PWM cycle, written at any point in the current PWM cycle by ISR or other routine.

## 2.7 OUTPUT LEVEL CONTROL

**Figure 13-6. Inverter On/Off**

The following procedure describes how to maintain TOUT as high or low (assume the inverter is off):

1. Turn off the auto reload bit. And then, the timer is stopped after the TCNTn reaches 0, TOUTn goes to high level (recommended).
2. Stop the timer by clearing the timer start/stop bit to 0. If  $TCNTn \leq TCMPn$  at that moment, the output level is high. If  $TCNTn > TCMPn$ , the output level is low.
3. The TOUTn can be inverted by the inverter on/off bit in TCON. The inverter removes the additional circuit to adjust the output level.

### 2.8 DEAD ZONE GENERATOR

The Dead Zone is for the PWM control in a power device. This function enables the insertion of the time gap between a turn-off of a switching device and a turn on of another switching device. This time gap prohibits the two switching devices from being turned on simultaneously, even for a very short time.

TOUT0 is the PWM output. nTOUT0 is the inversion of the TOUT0. If the dead zone is enabled, the output wave form of TOUT0 and nTOUT0 will be TOUT0\_DZ and nTOUT0\_DZ, respectively. nTOUT0\_DZ is routed to the TOUT1 pin.

In the dead zone interval, TOUT0\_DZ and nTOUT0\_DZ can never be turned on simultaneously.

Figure 13-7. The Wave Form When a Dead Zone Feature is Enabled

## 2.9 DMA REQUEST MODE

The PWM timer can generate a DMA request at every specific time. The timer keeps DMA request signals (nDMA\_REQ) low until the timer receives an ACK signal. When the timer receives the ACK signal, it makes the request signal inactive. The timer, which generates the DMA request, is determined by setting DMA mode bits (in TCFG1 register). If one of timers is configured as DMA request mode, that timer does not generate an interrupt request. The others can generate interrupt normally.

DMA mode configuration and DMA / interrupt operation

| DMA Mode | DMA Request | Timer0 INT | Timer1 INT | Timer2 INT | Timer3 INT | Timer4 INT |
|----------|-------------|------------|------------|------------|------------|------------|
| 0000     | No select   | ON         | ON         | ON         | ON         | ON         |
| 0001     | Timer0      | OFF        | ON         | ON         | ON         | ON         |
| 0010     | Timer1      | ON         | OFF        | ON         | ON         | ON         |
| 0011     | Timer2      | ON         | ON         | OFF        | ON         | ON         |
| 0100     | Timer3      | ON         | ON         | ON         | OFF        | ON         |
| 0101     | Timer4      | ON         | ON         | ON         | ON         | OFF        |
| 0110     | No select   | ON         | ON         | ON         | ON         | ON         |

Figure 13-8. Timer4 DMA Mode Operation

### 3 PWM TIMER CONTROL REGISTERS

#### 3.1 TIMER CONFIGURATION REGISTER0 (TCFG0)

Timer input clock Frequency =  $PCLK / \{\text{prescaler value} + 1\} / \{\text{divider value}\}$

{prescaler value} = 0~255

{divider value} = 2, 4, 8, 16

| Register | Address    | R/W | Description                         | Reset Value |
|----------|------------|-----|-------------------------------------|-------------|
| TCFG0    | 0x51000000 | R/W | Configures the two 8-bit prescalers | 0x00000000  |

| TCFG0            | Bit     | Description   | Initial State |
|------------------|---------|---|---------------|
| Reserved         | [31:24] |   | 0x00          |
| Dead zone length | [23:16] | These 8 bits determine the dead zone length. The 1 unit time of the dead zone length is equal to that of timer 0. | 0x00          |
| Prescaler 1      | [15:8]  | These 8 bits determine prescaler value for Timer 2, 3 and 4.  | 0x00          |
| Prescaler 0      | [7:0]   | These 8 bits determine prescaler value for Timer 0 and 1.   | 0x00          |

## 3.2 TIMER CONFIGURATION REGISTER1 (TCFG1)

| Register | Address    | R/W | Description                         | Reset Value |
|----------|------------|-----|-------------------------------------|-------------|
| TCFG1    | 0x51000004 | R/W | 5-MUX & DMA mode selection register | 0x00000000  |

| TCFG1    | Bit     | Description   | Initial State |
|----------|---------|---|---------------|
| Reserved | [31:24] |   | 00000000      |
| DMA mode | [23:20] | Select DMA request channel<br>0000 = No select (all interrupt) 0001 = Timer0<br>0010 = Timer1 0011 = Timer2<br>0100 = Timer3 0101 = Timer4<br>0110 = Reserved | 0000          |
| MUX 4    | [19:16] | Select MUX input for PWM Timer4.<br>0000 = 1/2 0001 = 1/4 0010 = 1/8<br>0011 = 1/16 01xx = External TCLK  | 0000          |
| MUX 3    | [15:12] | Select MUX input for PWM Timer3.<br>0000 = 1/2 0001 = 1/4 0010 = 1/8<br>0011 = 1/16 01xx = External TCLK  | 0000          |
| MUX 2    | [11:8]  | Select MUX input for PWM Timer2.<br>0000 = 1/2 0001 = 1/4 0010 = 1/8<br>0011 = 1/16 01xx = External TCLK  | 0000          |
| MUX 1    | [7:4]   | Select MUX input for PWM Timer1.<br>0000 = 1/2 0001 = 1/4 0010 = 1/8<br>0011 = 1/16 01xx = External TCLK  | 0000          |
| MUX 0    | [3:0]   | Select MUX input for PWM Timer0.<br>0000 = 1/2 0001 = 1/4 0010 = 1/8<br>0011 = 1/16 01xx = External TCLK  | 0000          |

Notice) When you use External TCLK, duty of TOUT may show slight error. External TCLK is sampled by PCLK in PWM module. But External TCLK and PCLK is asynchronous clock. So External TCLK may not be sampled at exact time. This slight error can be reduced when External clock is slower than PCLK. So we recommend using External PCLK under 1MHz.

(Ex. When PCLK is 66MHz and External PCLK is 1MHz, duty or jitter error can be 1.5%. When PCLK is 66MHz and External PCLK is 0.5MHz, duty or jitter error can be 0.75%)

## 3.3 TIMER CONTROL (TCON) REGISTER

| Register | Address    | R/W | Description            | Reset Value |
|----------|------------|-----|------------------------|-------------|
| TCON     | 0x51000008 | R/W | Timer control register | 0x00000000  |

# 14 REAL TIME CLOCK (RTC)

This chapter describes the functions and usage of Real Time Clock (RTC) in S3C2451 RISC microprocessor.

## 1 OVERVIEW

The Real Time Clock (RTC) unit can be operated by the backup battery when the system power is off. The data include the time by second, minute, hour, date, day, month, and year. The RTC unit works with an external 32.768 KHz crystal and can perform the alarm function.

### 1.1 FEATURES

The Real Time Clock includes the following features:

- BCD number: second, minute, hour, date, day, month, and year.
- Leap year generator
- Alarm function: alarm-interrupt or wake-up from power-off mode.
- Tick counter function: tick-interrupt or wake-up from power-off mode.
- Year 2000 problem is removed.
- Independent power pin (RTCVDD).
- Supports millisecond tick time interrupt for RTOS kernel time tick.

## 1.2 REAL TIME CLOCK OPERATION DESCRIPTION

Figure 14-1. Real Time Clock Block Diagram

## 1.2.1 Leap Year Generator

The leap year generator can determine the last date of each month out of 28, 29, 30, or 31, based on data from BCDDAY, BCDMON, and BCDYEAR. This block considers leap year in deciding on the last date. An 8-bit counter can only represent 2 BCD digits, therefore it cannot decide whether "00" year (the year with its last two digits zeros) is a leap year or not. For example, it cannot discriminate between 1900 and 2000. To solve this problem, the RTC block in S3C2451 has hard-wired logic to support the leap year in 2000. Note 1900 is not leap year while 2000 is leap year in general Gregorian calendar. Therefore, two digits of 00 in S3C2451 denote 2000, not 1900. So, RTC in S3C2451 supports from 1901 to 2099.

### 1.2.2 Read/Write Register

Bit 0 of the RTCCON register must be set high in order to write the BCD register in RTC block. To display the second, minute, hour, day, date, month, and year, the CPU must read the data in BCDSEC, BCDMIN, BCDHOUR, BCDDATE, BCDDAY, BCDMON, and BCDYEAR registers respectively in the RTC block. However, a one second deviation may exist because multiple registers are read. For example, when the user reads the registers from BCDYEAR to BCDMIN, the result is assumed to be 2059 (Year), 12 (Month), 31 (Date), 23 (Hour) and 59 (Minute). When the user read the BCDSEC register and the value ranges from 1 to 59 (Second), there is no problem, but, if the value is 0 sec., the year, month, date, hour, and minute may be changed to 2060 (Year), 1 (Month), 1 (Date), 0 (Hour) and 0 (Minute) because of the one second deviation that was mentioned. In this case, the user must re-read from BCDYEAR to BCDSEC if BCDSEC is zero.

### 1.2.3 Backup Battery Operation

The RTC logic can be driven by the backup battery, which supplies the power through the RTCVDD pin into the RTC block, even if the system power is off. When the system is off, the interfaces of the CPU and RTC logic must be blocked, and the backup battery only drives the oscillation circuit and the BCD counters to minimize power dissipation.

### 1.2.4 Alarm Function

The RTC generates ALMINT(alarm interrupt) and ALMWKUP(alarm wake-up) at a specified time in the power-down mode, power off mode or normal operation mode. In normal operation mode, If ALARM register value is a same to BCD register, ALMINT is activated as well as the ALMWKUP. In the power-off and power-down, If ALARM register value is a same to BCD register, ALMWKUP is activated. The RTC alarm register (RTCALM) determines the alarm enable/disable status and the condition of the alarm time setting.

### 1.2.5 Tick time interrupt

The RTC tick time is used for interrupt request. The TICNT register has an interrupt enable bit and the count value for the interrupt. The count value reaches '0' when the tick time interrupt occurs. Then the period of interrupt is as follows:

- Tick clock frequency (Hz) = RTC clock /  $2^n$   
- n: RTC clock divide value(decided by RTCCON[8:4] )
- Resolution = 1 / Tick clock frequency
- Clock range = Resolution \*  $2^{32}$

| Tick counter clock source selection | Tick clock source frequency(Hz) | Clock range (s) | Resolution (ms) |
|-------------------------------------|---------------------------------|-----------------|-----------------|
| TICSel = 1                          | 32768 ( $2^{15}$ )              | 0 ~ $2^{17}$    | 0.03            |
| TICsel2 = 0, TICSel =0              | 16384 ( $2^{14}$ )              | 0 ~ $2^{18}$    | 0.06            |
| TICsel2 = 1, TICSel =0              | 8192 ( $2^{13}$ )               | 0 ~ $2^{19}$    | 0.12            |
| TICsel2 = 2, TICSel =0              | 4096 ( $2^{12}$ )               | 0 ~ $2^{20}$    | 0.24            |
| TICsel2 = 3, TICSel =0              | 2048 ( $2^{11}$ )               | 0 ~ $2^{21}$    | 0.49            |
| TICsel2 = 6, TICSel =0              | 1024 ( $2^{10}$ )               | 0 ~ $2^{22}$    | 0.97            |
| TICsel2 = 7, TICSel =0              | 512 ( $2^9$ )                   | 0 ~ $2^{23}$    | 1.95            |
| TICsel2 = 8, TICSel =0              | 256 ( $2^8$ )                   | 0 ~ $2^{24}$    | 3.90            |
| TICsel2 = 4, TICSel =0              | 128 ( $2^7$ )                   | 0 ~ $2^{25}$    | 7.81            |
| TICsel2 = 9, TICSel =0              | 64 ( $2^6$ )                    | 0 ~ $2^{26}$    | 15.62           |
| TICsel2 = 10, TICSel =0             | 32 ( $2^5$ )                    | 0 ~ $2^{27}$    | 31.25           |
| TICsel2 = 11, TICSel =0             | 16 ( $2^4$ )                    | 0 ~ $2^{28}$    | 62.50           |
| TICsel2 = 12, TICSel =0             | 8 ( $2^3$ )                     | 0 ~ $2^{29}$    | 125             |
| TICsel2 = 13, TICSel =0             | 4 ( $2^2$ )                     | 0 ~ $2^{30}$    | 250             |
| TICsel2 = 14, TICSel =0             | 2                               | 0 ~ $2^{31}$    | 500             |
| TICsel2 = 5, TICSel =0              | 1                               | 0 ~ $2^{32}$    | 1000            |

**NOTE:** This RTC time tick may be used for real time operating system (RTOS) kernel time tick.

If time tick is generated by the RTC time tick, the time related function of RTOS will always synchronized in real time.

Figure 14-2. RTC Tick Interrupt Clock Scheme

Example) For 1 ms Tick interrupt generation.

- 1<sup>st</sup>) RTCCON[0]= 1'b1 ( RTC enable )
- 2<sup>nd</sup>) RTCCON[3]=1'b1 ( RTC clock counter reset).
- 3<sup>rd</sup>) RTCCON[3] = 1'b0 ( RTC clock counter enable)
- 4<sup>th</sup>) RTCCON[8:5] = 4'b0011 ( RTC divide clock selection.)
- 5<sup>th</sup>) TICNT1[6:0] = 7'h1 (Tick counter value setting).
- 6<sup>th</sup>) TICNT0[7] = 1'b1 (Tick counter enable).

1.2.6 32.768 kHz X-TAL Connection EXAMPLE

The Figure 14-3 shows a circuit of the RTC unit oscillation at 32.768 kHz.

Figure 14-3. Main Oscillator Circuit Example

## 1.5 INDIVIDUAL REGISTER DESCRIPTIONS

### 1.5.1 REAL TIME CLOCK CONTROL (RTCCON) REGISTER

The RTCCON register consists of 9 bits. It controls the read/write enable of the CLKSEL, CNTSEL and CLKRST for testing.

RTCEN bit can control all interfaces between the CPU and the RTC, Therefore it must be set to 1 in an RTC control routine to enable data read/write after a system reset. Before power off, the RTCEN bit is cleared to 0 to prevent inadvertent writing into BCD counter register.

CLKRST is counter reset for  $2^{15}$  Clock divider.(reference to Figure 15-1)

Before RTC clock setting,  $2^{15}$  Clock divider must be reset for exact RTC operation.

| Register | Address    | R/W | Description          | Reset Value |
|----------|------------|-----|----------------------|-------------|
| RTCCON   | 0x57000040 | R/W | RTC control register | 0x00        |

| RTCCON  | Bit   | Description   | Initial State |
|---------|-------|---|---------------|

### 1.5.2 Tick Time Count Register 0 (TICNT0)

The TICNT0 register determines tick interrupt enable and tick counter value

S3C2451 supports 32bits tic time counter.

So, from 14 to 8bits of 32bit tick time count value is selected at TICNT0 register (TICNT0[6:0]).

Lower 8bits of 15bit tick time count value is selected at TICNT1 register (TICNT1[7:0]).

Upper 17 bits of 32bit tick time count value is selected at TICNT2 register (TICNT0[16:0]).

#### NOTE

Tick time count value = (TICK TIME COUNT 0) x  $2^8$  + (TICK TIME COUNT 1) + (TICK TIME COUNT2) x  $2^{15}$

| Register | Address    | R/W | Description              | Reset Value |
|----------|------------|-----|--------------------------|-------------|
| TICNT0   | 0x57000044 | R/W | Tick time count register | 0x00        |

| TICNT             | Bit   | Description  | Initial State |
|-------------------|-------|--|---------------|
| TICK INT ENABLE   | [7]   | Tick time interrupt enable.<br>0 = Disable<br>1 = Enable | b'0           |
| TICK TIME COUNT 0 | [6:0] | [14:8] bits of 32 bit tick time count value              | b'0           |

### 1.5.3 Tick Time Count Register 1 (TICNT1)

| Register | Address    | R/W | Description                | Reset Value |
|----------|------------|-----|----------------------------|-------------|
| TICNT1   | 0x5700004C | R/W | Tick time count register 1 | 0x00        |

| TICNT1            | Bit   | Description                                 | Initial State |
|-------------------|-------|---|---------------|
| TICK TIME COUNT 1 | [7:0] | Lower 8 bits of 32bit tick time count value | b'000000      |

### 1.5.4 Tick Time Count Register 2 (TICNT2)

| Register | Address    | R/W | Description                | Reset Value |
|----------|------------|-----|----------------------------|-------------|
| TICNT2   | 0x57000048 | R/W | Tick time count register 2 | 0x00        |

| TICNT2            | Bit    | Description                                 | Initial State |
|-------------------|--------|---|---------------|
| TICK TIME COUNT 2 | [16:0] | High 17 bits of 32bit tick time count value | b'000000      |

### 1.5.5 RTC ALARM Control (RTCALM) Register

The RTCALM register determines the alarm enable and the alarm time. Note that the RTCALM register generates the alarm signal through both ALMINT and ALMWKUP as power mode.

For using ALMINT and ALMWKUP, ALMEN must be enable.

If compare value is year, ALMEN and YEAREN must be enable.

If compare values are year,mon,date,hour,min and sec, ALMEN, YEAREN, MONEN, DATEEN, HOUREN, MINEN and SECEN must be enable.

| Register | Address    | R/W | Description                | Reset Value |
|----------|------------|-----|----------------------------|-------------|
| RTCALM   | 0x57000050 | R/W | RTC alarm control register | 0x0         |

| RTCALM   | Bit | Description   | Initial State |
|----------|-----|---|---------------|
| Reserved | [7] |   | 0             |
| ALMEN    | [6] | Alarm global enable<br>0 = Disable, 1 = Enable<br><b>Note:</b> For using ALMINT and ALMWKUP, set ALMEN=1'b1 | 0             |
| YEAREN   | [5] | Year alarm enable<br>0 = Disable, 1 = Enable  | 0             |
| MONEN    | [4] | Month alarm enable<br>0 = Disable, 1 = Enable   | 0             |
| DATEEN   | [3] | Date alarm enable<br>0 = Disable, 1 = Enable  | 0             |
| HOUREN   | [2] | Hour alarm enable<br>0 = Disable, 1 = Enable  | 0             |
| MINEN    | [1] | Minute alarm enable<br>0 = Disable, 1 = Enable  | 0             |
| SECEN    | [0] | Second alarm enable<br>0 = Disable, 1 = Enable  | 0             |

## 1.5.6 ALARM Second Data (ALMSEC) Register

| Register | Address    | R/W | Description                | Reset Value |
|----------|------------|-----|----------------------------|-------------|
| ALMSEC   | 0x57000054 | R/W | Alarm second data Register | 0x0         |

| ALMSEC   | Bit   | Description                          | Initial State |
|----------|-------|--------------------------------------|---------------|
| Reserved | [7]   |                                      | 0             |
| SECDATA  | [6:4] | BCD value for alarm second.<br>0 ~ 5 | 000           |
|          | [3:0] | 0 ~ 9                                | 0000          |

## 1.5.7 ALARM MIN Data (ALMMIN) Register

| Register | Address    | R/W | Description                | Reset Value |
|----------|------------|-----|----------------------------|-------------|
| ALMMIN   | 0x57000058 | R/W | Alarm minute data Register | 0x00        |

| ALMMIN   | Bit   | Description                          | Initial State |
|----------|-------|--------------------------------------|---------------|
| Reserved | [7]   |                                      | 0             |
| MINDATA  | [6:4] | BCD value for alarm minute.<br>0 ~ 5 | 000           |
|          | [3:0] | 0 ~ 9                                | 0000          |

## 1.5.8 ALARM HOUR Data (ALM HOUR) Register

| Register | Address    | R/W | Description              | Reset Value |
|----------|------------|-----|--------------------------|-------------|
| ALM HOUR | 0x5700005C | R/W | Alarm hour data Register | 0x0         |

| ALM HOUR | Bit   | Description                        | Initial State |
|----------|-------|------------------------------------|---------------|
| Reserved | [7:6] |                                    | 00            |
| HOURDATA | [5:4] | BCD value for alarm hour.<br>0 ~ 2 | 00            |
|          | [3:0] | 0 ~ 9                              | 0000          |

## 1.5.9 ALARM DATE Data (ALMDATE) Register

| Register | Address    | R/W | Description             | Reset Value |
|----------|------------|-----|-------------------------|-------------|
| ALMDATE  | 0x57000060 | R/W | Alarm day data Register | 0x01        |

| ALMDATE  | Bit   | Description  | Initial State |
|----------|-------|--|---------------|
| Reserved | [7:6] |  | 00            |
| DATEDATA | [5:4] | BCD value for alarm date, from 0 to 28, 29, 30, 31.<br>0 ~ 3 | 00            |
|          | [3:0] | 0 ~ 9  | 0001          |

## 1.5.10 ALARM MONTH Data (ALMMON) Register

| Register | Address    | R/W | Description               | Reset Value |
|----------|------------|-----|---------------------------|-------------|
| ALMMON   | 0x57000064 | R/W | Alarm month data Register | 0x01        |

| ALMMON   | Bit   | Description                         | Initial State |
|----------|-------|-------------------------------------|---------------|
| Reserved | [7:5] |                                     | 00            |
| MONDATA  | [4]   | BCD value for alarm month.<br>0 ~ 1 | 0             |
|          | [3:0] | 0 ~ 9                               | 0001          |

## 1.5.11 ALARM YEAR Data (ALMYEAR) Register

| Register | Address    | R/W | Description              | Reset Value |
|----------|------------|-----|--------------------------|-------------|
| ALMYEAR  | 0x57000068 | R/W | Alarm year data Register | 0x0         |

| ALMYEAR  | Bit   | Description                | Initial State |
|----------|-------|----------------------------|---------------|
| YEARDATA | [7:4] | BCD value for year.<br>0~9 | 0x0           |

**NOTES**

# 15 UART

## 1 OVERVIEW

The S3C2451 Universal Asynchronous Receiver and Transmitter (UART) provide four independent asynchronous serial I/O (SIO) ports, each of which can operate in Interrupt-based or DMA-based mode. The UART can support bit rates up to 3Mbps bps. Each UART channel contains two 64-byte FIFOs for receiver and transmitter.

The S3C2451 UART includes programmable baud rates, infrared (IR) transmit/receive, one or two stop bit insertion, 5-bit, 6-bit, 7-bit or 8-bit data width and parity checking.

Each UART contains a baud-rate generator, transmitter, receiver and a control unit, as shown in Figure 15-1. The baud-rate generator can be clocked by PCLK, EXTUARTCLK or divided EPLL clock. The transmitter and the receiver contain 64-byte FIFOs and data shifters. Data is written to FIFO and then copied to the transmit shifter before being transmitted. The data is then shifted out by the transmit data pin (TxDn). Meanwhile, received data is shifted from the receive data pin (RxDn), and then copied to FIFO from the shifter.

### 1.1 FEATURES

- RxD0, TxD0, RxD1, TxD1, RxD2, TxD2, RxD3 and TxD3 with DMA-based or interrupt-based operation
- UART Ch 0, 1, 2 and 3 with IrDA 1.0 & 64-byte FIFO
- UART Ch 0, 1 and 2 support Auto Flow Control with nRTS0, nCTS0, nRTS1, nCTS1, nRTS2 and nCTS2 signals
- Supports high-speed operation up to 3Mbps (in case of using EXTUARTCLK, divided EPLL clock)

## 2 BLOCK DIAGRAM

Figure 15-1. UART Block Diagram (with FIFO)

## 2.1 UART OPERATION

The following sections describe the UART operations that include data transmission, data reception, auto flow control, interrupt generation, Loopback mode, Infrared mode, and baud-rate generation.

### 2.1.1 Data Transmission

The data frame for transmission is programmable. It consists of a start bit, 5 to 8 data bits, an optional parity bit and 1 to 2 stop bits, which can be specified by the line control register (ULCONn). The transmitter can also produce the break condition, which forces the serial output to logic 0 state for one frame transmission time. This block transmits break signals after the present transmission word is transmitted completely. After the break signal transmission, it continuously transmits data into the Tx FIFO (Tx holding register in the case of Non-FIFO mode).

### 2.1.2 Data Reception

Like the transmission, the data frame for reception is also programmable. It consists of a start bit, 5 to 8 data bits, an optional parity bit and 1 to 2 stop bits in the line control register (ULCONn). The receiver can detect overrun error, parity error, frame error and break condition, each of which can set an error flag.

- The overrun error indicates that new data has overwritten the old data before the old data has been read.
- The parity error indicates that the receiver has detected an unexpected parity condition.
- The frame error indicates that the received data does not have a valid stop bit.
- The break condition indicates that the RxDn input is held in the logic 0 state for a duration longer than one frame transmission time.

Receive time-out condition occurs when it does not receive any data during the 3 word time (this interval follows the setting of Word Length bit) and the Rx FIFO is not empty in the FIFO mode.

**2.1.3 Auto Flow Control (AFC)**

UART 0, UART 1 and UART 2 support auto flow control with nRTS and nCTS signals. In AFC, nCTS signals control the operation of the transmitter, and nRTS depends on the condition of the receiver.

The UART's transmitter transfers the data in FIFO only when nCTS signals are activated(Low) (In AFC, nCTS means that other UART's FIFO is ready to receive data or not).

Before the UART receives data, nRTS signal has to be activated(Low) when its receive FIFO has a spare space more than 32-byte(FIFO contains less than 32-byte). And nRTS signal has to be inactivated(High) when its receive FIFO has a spare under 32-byte(FIFO contains equal or more than **32-byte**) in case of RTS trigger level is **32byte**. (In AFC, nRTS means that its own receive FIFO is ready to receive data or not).

**Figure 15-2. UART AFC Interface**

**NOTE**

UART 3 does not support AFC function, because the S3C2451 has no nRTS 3 and nCTS 3. S3C2451's AFC does not support the RS-232C interface.

**Table 15-1. Example of nRTS signal change by FIFO Spare size (In case of Reception Case in UART A)**

| RX side        |                  |             |                         | TX side     |                            |
|----------------|------------------|-------------|-------------------------|-------------|----------------------------|
| FIFO Contains  | FIFO Spare Space | nRTS Signal | nRTS Meaning            | nCTS Signal | nCTS Meaning               |
| 33 byte        | 31 byte          | High        | Not ready to receive    | High        | Don't send data to RX side |
| <b>32 byte</b> | 32 byte          | High        | Not ready to receive    | High        | Don't send data to RX side |
| 31 byte        | <b>33 byte</b>   | <b>Low</b>  | <b>Ready to Receive</b> | Low         | Send data to RX side       |
| 30 byte        | <b>34 byte</b>   | <b>Low</b>  | <b>Ready to Receive</b> | Low         | Send data to RX side       |

### 2.1.4 Non Auto-Flow Control (Controlling nRTS and nCTS by Software)

If users want to connect a UART to a Modem, disable auto flow control bit in UMCONn register and control the signal of nRTS by software.

#### Example:

##### Rx Operation with FIFO

1. Select receive mode (Interrupt or DMA mode).
2. Check the value of Rx FIFO count in UFSTATn register. If the value is less than 32, users have to set the value of UMCONn[0] to '1' (activating nRTS), and if it is equal or larger than 32 users have to set the value to '0' (inactivating nRTS).
3. Repeat the Step 2.

##### Tx Operation with FIFO

1. Select transmit mode (Interrupt or DMA mode).
2. Check the value of UMSTATn[0]. If the value is '1' (activating nCTS), users write the data to Tx FIFO register.
3. Repeat the Step 2.

### 2.1.5 RS-232C Interface

If the user wants to connect the UART to modem interface (instead of null modem), nRTS, nCTS, nDSR, nDTR, DCD and nRI signals are needed. In this case, the users can control these signals with general I/O ports by software because the AFC does not support the RS-232C interface.

### 2.1.6 Interrupt/DMA Request Generation

Each UART of the S3C2451 has seven status (Tx/Rx/Error) signals: Overrun error, Parity error, Frame error, Break, Receive buffer data ready, Transmit buffer empty, and Transmit shifter empty, all of which are indicated by the corresponding UART status register (UTRSTATn/UERSTATn).

The overrun error, parity error, frame error and break condition are referred to as the receive error status. Each of which can cause the receive error status interrupt request, if the receive-error-status-interrupt-enable bit is set to one in the control register, UCONn. When a receive-error-status-interrupt-request is detected, the signal causing the request can be identified by reading the value of UERSTSTn.

When the receiver transfers the data of the receive shifter to the receive FIFO register in FIFO mode and the number of received data reaches Rx FIFO Trigger Level, Rx interrupt is generated. If the Receive mode is in control register (UCONn) and is selected as 1 (Interrupt request or polling mode). In the Non-FIFO mode, transferring the data of the receive shifter to receive holding register will cause Rx interrupt under the Interrupt request and polling mode.

When the transmitter transfers data from its transmit FIFO register to its transmit shifter and the number of data left in transmit FIFO reaches Tx FIFO Trigger Level, Tx interrupt is generated, if Transmit mode in control register is selected as Interrupt request or polling mode. In the Non-FIFO mode, transferring data from the transmit holding register to the transmit shifter will cause Tx interrupt under the Interrupt request and polling mode.

Note that the Tx interrupt is always requested whenever the number of data in the transmit FIFO is smaller than the trigger level. This means that an interrupt is requested as soon as you enable the Tx interrupt unless you fill the Tx buffer prior to that. It is recommended to fill the Tx buffer first and then enable the Tx interrupt.

If the Receive mode and Transmit mode in control register are selected as the DMA request mode then DMA request occurs instead of Rx or Tx interrupt in the situation mentioned above.

**Table 15-2. Interrupts in Connection with FIFO**

| Type            | FIFO Mode  | Non-FIFO Mode   |
|-----------------|--|---|
| Rx Interrupt    | Generated whenever receive data reaches the trigger level of receive FIFO.<br>Generated when the number of data in FIFO does not reaches Rx FIFO trigger Level and does not receive any data during 3 words time (receive time out). This interval follows the setting of Word Length bit. | Generated by the receiving holding register whenever receive buffer becomes full.                           |
| Tx Interrupt    | Generated whenever transmit data reaches the trigger level of transmit FIFO (Tx FIFO trigger Level).   | Generated by the transmitting holding register whenever transmit buffer becomes empty.                      |
| Error Interrupt | Generated when frame error, parity error, or break signal are detected.<br>Generated when it gets to the top of the receive FIFO without reading out data in it (overrun error).   | Generated by all errors. However if another error occurs at the same time, only one interrupt is generated. |

2.1.7 UART Error Status FIFO

UART has the error status FIFO besides the Rx FIFO register. The error status FIFO indicates which data, among FIFO registers, is received with an error. The error interrupt will be issued only when the data, which has an error, is ready to read out. To clear the error status FIFO, the URXHn with an error and UERSTATn must be read out.

For example,

It is assumed that the UART Rx FIFO receives A, B, C, D and E characters sequentially and the frame error occurs while receiving 'B', and the parity error occurs while receiving 'D'.

The actual UART receive error will not generate any error interrupt because the character which is received with an error would have not been read. The error interrupt will occur once the character is read.

Figure 15-3 shows the UART receiving the five characters including the two errors.

| Time | Sequence Flow                 | Error Interrupt                           | Note                        |
|------|-------------------------------|---|-----------------------------|
| #0   | When no character is read out | -   |                             |
| #1   | A, B, C, D, and E is received | -   |                             |
| #2   | After A is read out           | The frame error (in B) interrupt occurs.  | The 'B' has to be read out. |
| #3   | After B is read out           | -   |                             |
| #4   | After C is read out           | The parity error (in D) interrupt occurs. | The 'D' has to be read out. |
| #5   | After D is read out           | -   |                             |
| #6   | After E is read out           | -   |                             |

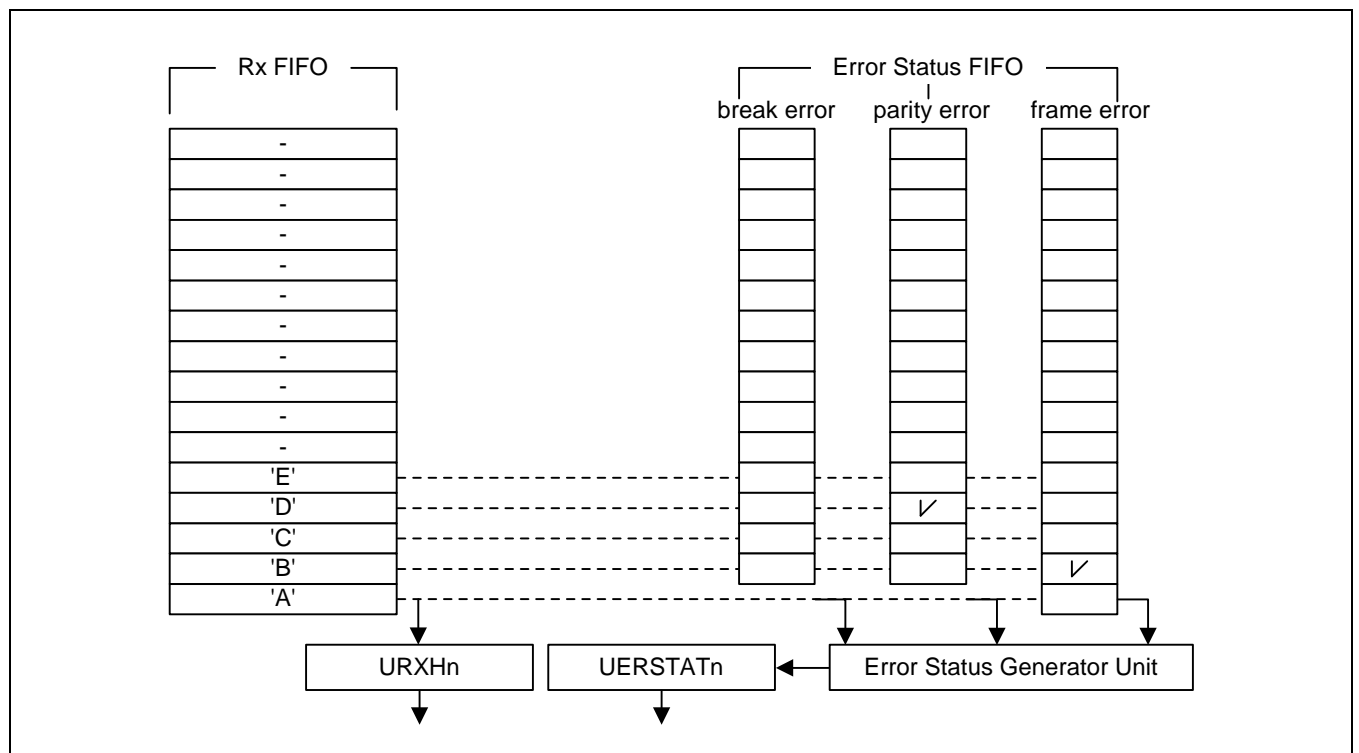

Figure 15-3. Example showing UART Receiving 5 Characters with 2 Errors

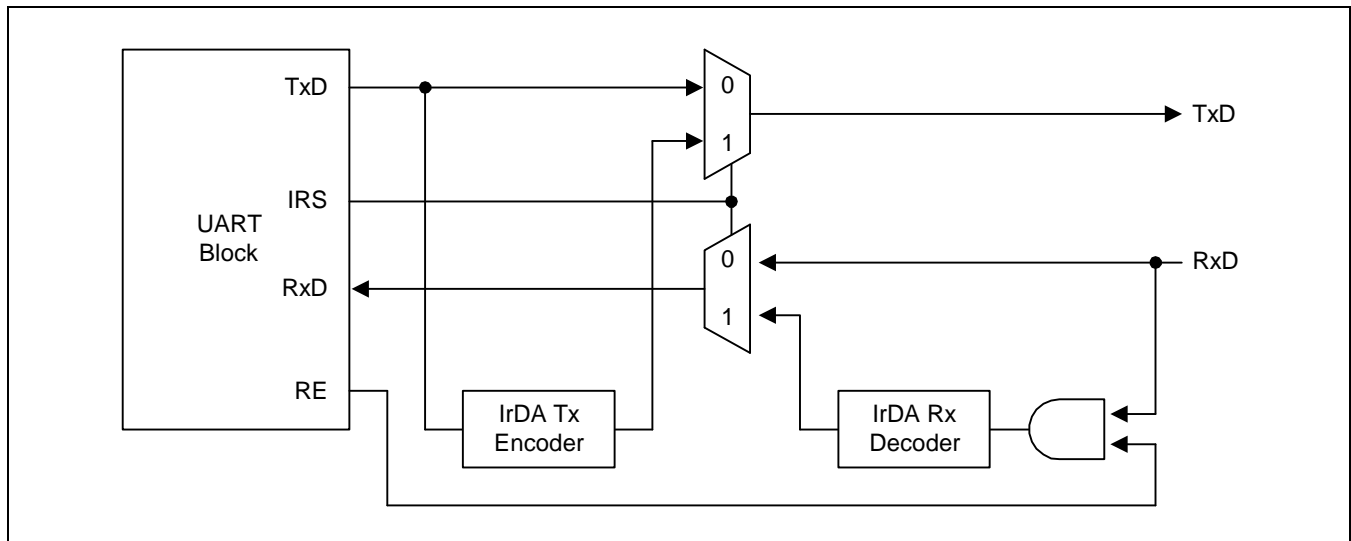

**2.1.8 Loopback Mode**

The S3C2451 UART provides a test mode referred to as the Loopback mode, to aid in isolating faults in the communication link. This mode structurally enables the connection of RXD and TXD in the UART. In this mode, therefore, transmitted data is received to the receiver, via RXD. This feature allows the processor to verify the internal transmit and to receive the data path of each SIO channel. This mode can be selected by setting the loopback bit in the UART control register (UCONn).

**2.1.9 Infrared (IR) Mode**

The S3C2451 UART block supports infrared (IR) transmission and reception, which can be selected by setting the Infrared-mode bit in the UART line control register (ULCONn). Figure 15-4 illustrates how to implement the IR mode.

In IR transmit mode, the transmit pulse comes out at a rate of 3/16, the normal serial transmit rate (when the transmit data bit is zero); In IR receive mode, the receiver must detect the 3/16 pulsed period to recognize a zero value (see the frame timing diagrams shown Figure 15-6 and Figure 15-7).

Figure 15-7. Infrared Receive Mode Frame Timing Diagram

### 2.1.10 Baud-rate Generation

Each UART's baud-rate generator provides the serial clock for the transmitter and the receiver. The source clock for the baud-rate generator can be selected with the S3C2451's internal system clock(PCLK or divided EPLL clock) or EXTUARTCLK. UARTCLK (Clock frequencies of 16 times the baud rate) are used for sampling serial data to minimize error. UARTCLK is generated by dividing the source clock. The baud-rate clock is generated by dividing the UARTCLK by 16.

The value stored in the baud rate divisor register (UBRDIVn) and dividing slot register(UDIVSLOTn), are used to determine the serial Tx/Rx clock rate (baud rate) as follows:

$$\begin{aligned} \text{DIV\_VAL} &= (\text{SRCCLK} / \text{UARTCLK}) - 1 \\ &= \{ \text{SRCCLK} / (\text{baud rate} \times 16) \} - 1 \\ &= \text{UBRDIVn} + (\text{num of 1's in UDIVSLOTn})/16 \\ &\quad (\text{SRCCLK : PCLK, EXTUARTCLK or divided EPLL clock}) \end{aligned}$$

Where, Integer part of DIV\_VAL should be from 1 to ( $2^{16}-1$ ), but can be set zero when SRCCLK is EXTUARTCLK or divided EPLL clock. (Please refer the Figure 15-3 by this effect)

Using UDIVSLOT which is the factor of floating point divisor, you can make more accurate baud rate. (when UBRDIVn is 0, floating part will not be affected.)

For example, if the baud rate is 115200 bps and SRCCLK is 40 MHz, UBRDIVn and UDIVSLOTn are :

$$\begin{aligned} \text{DIV\_VAL} &= \{ 40000000 / (115200 \times 16) \} - 1 \\ &= 21.7 - 1 \quad (\text{actual dividing value is 21.7}) \\ &= 20.7 \quad (\text{for register setting, 20.7 is needed here}) \end{aligned}$$

\* UBRDIVn = 20 ( integer part of DIV\_VAL )

$$\begin{aligned} (\text{num of 1's in UDIVSLOTn})/16 &= 0.7 \\ (\text{num of 1's in UDIVSLOTn}) &= 11 \end{aligned}$$

\* UDIVSLOTn = 0xEEEA(1110\_1110\_1110\_1010b), 0xDDD5(1101\_1101\_1101\_1010b) or etc.  
( floating point part of DIV\_VAL )

As a result, DIV\_VAL = 20.6875

We recommend to select UDIVSLOTn in the Table 15-4 (at 23 page). For convenience, summary of Table is presented below.

| Floating point part | Num of 1's | UDIVSLOTn | Floating point part | Num of 1's | UDIVSLOTn |
|---------------------|------------|-----------|---------------------|------------|-----------|
| 0                   | 0          | 0x0000    | 0.5                 | 8          | 0x5555    |
| 0.0625              | 1          | 0x0080    | 0.5625              | 9          | 0xD555    |
| 0.125               | 2          | 0x0808    | 0.625               | 10         | 0xD5D5    |
| 0.1875              | 3          | 0x0888    | 0.6875              | 11         | 0xDDD5    |
| 0.25                | 4          | 0x2222    | 0.75                | 12         | 0xDDDD    |
| 0.3125              | 5          | 0x4924    | 0.8125              | 13         | 0xDFDD    |
| 0.375               | 6          | 0x4A52    | 0.875               | 14         | 0xDFDF    |
| 0.4375              | 7          | 0x54AA    | 0.9375              | 15         | 0xFFDF    |

### 2.1.11 Baud-Rate Error Tolerance

UART Frame error should be less than 1.87%(3/160).

$$\text{UART Frame error} = \{ |\text{Real Frame Length} - \text{Ideal Frame Length}| / \text{Ideal Frame Length} \} \times 100\%$$

$$= \{ |\text{Ideal baudrate} - \text{Real baudrate}| / \text{Real baudrate} \} \times 100\%$$

$$\text{Real Frame Length} = 1 \text{ Frame} / \text{Real UART baudrate} = 1 \text{ Frame} \times (\text{DIV\_VAL}+1) \times 16 / \text{SRCCLK}$$

Where Real UART baudrate =  $\{ \text{SRCCLK} / (\text{DIV\_VAL}+1) \} / 16$

$$\text{Ideal Frame Length} = 1 \text{ Frame} / \text{Ideal UART baudrate}$$

#### NOTE

1Frame = start bit + data bit + parity bit + stop bit.

### 2.1.12 UART Clock and PCLK Relation

The frequency of UARTCLK(Clock of 16 times baud-rate) must be no more than 5.5/3 times faster than the frequency of PCLK :

$$F_{\text{UARTCLK}} \leq 5.5/3 \times F_{\text{PCLK}}$$

$$F_{\text{UARTCLK}} = \text{baudrate} \times 16$$

This allows sufficient time to write the received data to the receive FIFO

| Parameter   | Symbol            | Min   | Typ | Max | Unit |
|---|-------------------|-------|-----|-----|------|
| PCLK speed for UART operating (Baudrate is 1Mbps) | $F_{\text{PCLK}}$ | 8.72  | –   | –   | MHz  |
| PCLK speed for UART operating (Baudrate is 2Mbps) | $F_{\text{PCLK}}$ | 17.45 | –   | –   | MHz  |
| PCLK speed for UART operating (Baudrate is 3Mbps) | $F_{\text{PCLK}}$ | 26.18 | –   | –   | MHz  |

### 2.1.13 UART Clock speed/UART Clock selection guide for 3Mbps

For using 3Mbps, EPLL should be either 48MHz or 96MHz. Or EXTUARTCLK should be 48MHz.

**Table 15-3. Clock, EPLL Speed Guide**

| Parameter  | Min | Typ    | Max       | Unit |
|--|-----|--------|-----------|------|
| UART source clock(divided EPLL clock)                                      | –   | –      | 50        | MHz  |
| EPLL clock for divided EPLL clock(by UARTDIV of CLKDIV1, refer Figure 2-9) | –   | –      | 100       | MHz  |
| EPLL clock(UART source clock is divided EPLL) (3Mbps)                      | –   | 48, 96 | –         | MHz  |
| EXTUARTCLK (UART source clock is EXTUARTCLK)                               | –   | 48     |           | MHz  |
| Baudrate (UART source clock is EXTUARTCLK, divided EPLL clock)             | –   |        | 3,000,000 | bps  |

When SRCCLK is PCLK, Integer part of DIV\_VAL should be equal or larger than 1(divide SRCCLK by 2). Hence maximum baudrate is limited. (2.0625Mbps at typical PCLK 66MHz)

### 3 UART SPECIAL REGISTERS

#### 3.1 UART LINE CONTROL REGISTER

There are four UART line control registers including ULCON0, ULCON1, ULCON2 and ULCON3 in the UART block.

| Register | Address    | R/W | Description                          | Reset Value |
|----------|------------|-----|--------------------------------------|-------------|
| ULCON0   | 0x50000000 | R/W | UART channel 0 line control register | 0x00        |
| ULCON1   | 0x50004000 | R/W | UART channel 1 line control register | 0x00        |
| ULCON2   | 0x50008000 | R/W | UART channel 2 line control register | 0x00        |
| ULCON3   | 0x5000C000 | R/W | UART channel 3 line control register | 0x00        |

| ULCONn             | Bit   | Description  | Initial State |
|--------------------|-------|--|---------------|
| Reserved           | [7]   | –  | 0             |
| Infrared Mode      | [6]   | Determine whether or not to use the Infrared mode.<br>0 = Normal mode operation<br>1 = Infrared Tx/Rx mode   | 0             |
| Parity Mode        | [5:3] | Specify the type of parity generation and checking during UART transmit and receive operation.<br>0xx = No parity<br>100 = Odd parity<br>101 = Even parity<br>110 = Parity forced/checked as 1<br>111 = Parity forced/checked as 0 | 000           |
| Number of Stop Bit | [2]   | Specify how many stop bits are to be used for end-of-frame signal.<br>0 = One stop bit per frame<br>1 = Two stop bit per frame   | 0             |
| Word Length        | [1:0] | Indicate the number of data bits to be transmitted or received per frame.<br>00 = 5-bits    01 = 6-bits<br>10 = 7-bits    11 = 8-bits  | 00            |

### 3.2 UART CONTROL REGISTER

There are four UART control registers including UCON0, UCON1, UCON2 and UCON3 in the UART block.

| Register | Address    | R/W | Description                     | Reset Value |
|----------|------------|-----|---------------------------------|-------------|
| UCON0    | 0x50000004 | R/W | UART channel 0 control register | 0x00        |
| UCON1    | 0x50004004 | R/W | UART channel 1 control register | 0x00        |
| UCON2    | 0x50008004 | R/W | UART channel 2 control register | 0x00        |
| UCON3    | 0x5000C004 | R/W | UART channel 3 control register | 0x00        |

| UCONn                            | Bit     | Description  | Initial State |
|----------------------------------|---------|--|---------------|
| Clock Selection                  | [11:10] | Select PCLK, EXTUARTCLK(External UART clock) or divided EPLL clock for source clock of the UART. <b>(note 5)</b><br>00, 10 <b>(note 1)</b> = PCLK<br>01 = EXTUARTCLK<br>11 = Divided EPLL clock (Refer to the Clock divider control register1 (CLKDIV1) in the system controller). | 0             |
| Tx Interrupt Type                | [9]     | Interrupt request type.<br>0 = Pulse (Interrupt is requested as soon as the Tx buffer becomes empty in Non-FIFO mode or reaches Tx FIFO Trigger Level in FIFO mode.)   | 0             |
| Rx Interrupt Type                | [8]     | Interrupt request type.<br>0 = Pulse (Interrupt is requested the instant Rx buffer receives the data in Non-FIFO mode or reaches Rx FIFO Trigger Level in FIFO mode.)  | 0             |
| Rx Time Out Enable               | [7]     | Enable/Disable Rx time out interrupt when UART FIFO is enabled. The interrupt is a receive interrupt. <b>(note 2)</b><br>0 = Disable                      1 = Enable   | 0             |
| Rx Error Status Interrupt Enable | [6]     | Enable the UART to generate an interrupt upon an exception, such as a break, frame error, parity error, or overrun error during a receive operation.<br>0 = Do not generate receive error status interrupt.<br>1 = Generate receive error status interrupt.                        | 0             |
| Loopback Mode                    | [5]     | Setting loopback bit to 1 causes the UART to enter the loopback mode. This mode is provided for test purposes only.<br>0 = Normal operation      1 = Loopback mode   | 0             |
| Send break signal                | [4]     | Setting this bit causes the UART to send a break during 1 frame time. This bit is auto-cleared after sending the break signal<br>0 = Normal transmit      1 = Send break signal  | 0             |

| UCONn                     | Bit   | Description  | Initial State |
|---------------------------|-------|--|---------------|
| Transmit Mode<br>(note 3) | [3:2] | Determine which function is currently able to write Tx data to the UART transmit buffer register.<br>00 = Disable<br>01 = Interrupt request (note 6) or polling mode<br>10 = DMA request( request signal 0)<br>11 = DMA request( request signal 1) | 00            |
| Receive Mode              | [1:0] | Determine which function is currently able to read data from UART receive buffer register.<br>00 = Disable (note 4)<br>01 = Interrupt request or polling mode<br>10 = DMA request( request signal 0)<br>11 = DMA request( request signal 1)        | 00            |

**NOTES:**

- When you want to change EXTUARTCLK to PCLK for UART baudrate, clock selection field must be set to 2'b10.
- When the UART does not reach the FIFO trigger level and does not receive data during 3 words time in Interrupt receive mode with FIFO, the Rx interrupt will be generated (receive time out), and the users should check the FIFO status and read out the rest.
- If Tx DMA request signal were 0, Rx DMA request signal should be 1. They can't share request signal 0 or 1 in common. (UCONn[3:2], UCONn[1:0]) = ("10b", "11b") or ("11b", "10b")
- When Receive mode is enabled, changing of GPIO status affect to RXD line(example : GPIO RXD ->GPIO input -> GPIO RXD), dummy data can be read at RX FIFO.  
Recommended steps are follows.
  - Disable Receive Mode
  - Set GPIO as UART mode.
  - RX FIFO reset.
  - Interrupt unmask(enable) if needed
  - Enable Receive Mode(Set Receive Mode to Interrupt/DMA request or polling mode)
- In the middle of operation, changing source clock selection or speed of source clock is prohibited. These must be done after finishing transmission/receiving
- Mask bit of INTMSK(Interrupt Mask Register ) should be 0 (unmask) before enabling Transmit mode as Interrupt request mode.

### 3.3 UART FIFO CONTROL REGISTER

There are four UART FIFO control registers including UFCON0, UFCON1, UFCON2 and UFCON3 in the UART block.

| Register | Address    | R/W | Description                          | Reset Value |
|----------|------------|-----|--------------------------------------|-------------|
| UFCON0   | 0x50000008 | R/W | UART channel 0 FIFO control register | 0x0         |
| UFCON1   | 0x50004008 | R/W | UART channel 1 FIFO control register | 0x0         |
| UFCON2   | 0x50008008 | R/W | UART channel 2 FIFO control register | 0x0         |
| UFCON3   | 0x5000C008 | R/W | UART channel 3 FIFO control register | 0x0         |

| UFCONn                         | Bit   | Description   | Initial State |
|--------------------------------|-------|---|---------------|
| Tx FIFO Trigger Level (note 2) | [7:6] | Determine the trigger level of transmit FIFO.<br>00 = Empty<br>01 = 16-byte<br>10 = 32-byte<br>11 = 48-byte | 00            |
| Rx FIFO Trigger Level (note 2) | [5:4] | Determine the trigger level of receive FIFO.<br>00 = 1-byte<br>01 = 8-byte<br>10 = 16-byte<br>11 = 32-byte  | 00            |
| Reserved                       | [3]   | –   | 0             |
| Tx FIFO Reset                  | [2]   | Auto-cleared after resetting FIFO<br>0 = Normal<br>1 = Tx FIFO reset  | 0             |
| Rx FIFO Reset                  | [1]   | Auto-cleared after resetting FIFO<br>0 = Normal<br>1 = Rx FIFO reset  | 0             |
| FIFO Enable (note 2)           | [0]   | 0 = Disable (note 1)<br>1 = Enable  | 0             |

#### NOTES:

- At DMA mode, FIFO Enable should be Disabled.
- Please refer the following recommendation for Interrupt / DMA mode.

| Mode           | FIFO enable             | TX FIFO Trigger level | RX FIFO Trigger level | RX time out enable |
|----------------|-------------------------|-----------------------|-----------------------|--------------------|
| Interrupt mode | Enable (FIFO mode)      | 16~48byte             | 8~32byte              | enable             |
| DMA mode       | Disable (Non-FIFO mode) | n/a                   | n/a                   | n/a                |

### 3.4 UART MODEM CONTROL REGISTER

There are three UART MODEM control registers including UMCON0 and UMCON1 in the UART block.

| Register | Address    | R/W | Description                           | Reset Value |
|----------|------------|-----|---------------------------------------|-------------|
| UMCON0   | 0x5000000C | R/W | UART channel 0 Modem control register | 0x0         |
| UMCON1   | 0x5000400C | R/W | UART channel 1 Modem control register | 0x0         |
| UMCON2   | 0x5000800C | R/W | UART channel 2 Modem control register | 0x0         |

| UMCONn                  | Bit   | Description   | Initial State |
|-------------------------|-------|---|---------------|
| RTS trigger Level       | [7:5] | When AFC bit is enabled, these bits determine when to inactivate (High) nRTS signal.<br>000 = When RX FIFO contains 63 bytes.<br>001 = When RX FIFO contains 56 bytes.<br>010 = When RX FIFO contains 48 bytes.<br>011 = When RX FIFO contains 40 bytes.<br>100 = When RX FIFO contains 32 bytes.<br>101 = When RX FIFO contains 24 bytes.<br>110 = When RX FIFO contains 16 bytes.<br>111 = When RX FIFO contains 8 bytes. | 000           |
| Auto Flow Control (AFC) | [4]   | 0 = Disable<br>1 = Enable   | 0             |
| Reserved                | [3:1] | These bits must be 0's  | 00            |
| Request to Send         | [0]   | If AFC bit is enabled, this value will be ignored. In this case the S3C2451 will control nRTS automatically.<br>If AFC bit is disabled, nRTS must be controlled by software.<br>0 = 'H' level (Inactivate nRTS)<br>1 = 'L' level (Activate nRTS)  | 0             |

**NOTES:**

1. UART 3 does not support AFC function, because the S3C2451 has no nRTS3 and nCTS3.
2. If AFC bit is enabled and Time-out bit is disabled, RTS trigger level must be larger than Rx FIFO trigger level.
3. Example ) RX interrupt mode, RTS trigger level b101(24byte), RX FIFO trigger level b10(16byte).  
This example shows RX FIFO always contains equal or less than 24 bytes.  
(have space equal or larger than 40bytes.)

| FIFO contains | FIFO Spare space | nRTS signal | Interrupt | Note                  |
|---------------|------------------|-------------|-----------|-----------------------|
| 24 byte       | 40 byte          | High        | -         | RTS trigger Level     |
| 23 byte       | 41 byte          | Low         | -         |                       |
| ...           | ...              | Low         | -         |                       |
| 17 byte       | 47 byte          | Low         | -         |                       |
| 16 byte       | 48 byte          | Low         | Occur     | RX FIFO trigger Level |
| 15 byte       | 49 byte          | Low         | -         |                       |

### 3.5 UART TX/RX STATUS REGISTER

There are four UART Tx/Rx status registers including UTRSTAT0, UTRSTAT1, UTRSTAT2 and UTRSTAT3 in the UART block.

| Register | Address    | R/W | Description                          | Reset Value |
|----------|------------|-----|--------------------------------------|-------------|
| UTRSTAT0 | 0x50000010 | R   | UART channel 0 Tx/Rx status register | 0x6         |
| UTRSTAT1 | 0x50004010 | R   | UART channel 1 Tx/Rx status register | 0x6         |
| UTRSTAT2 | 0x50008010 | R   | UART channel 2 Tx/Rx status register | 0x6         |
| UTRSTAT3 | 0x5000C010 | R   | UART channel 3 Tx/Rx status register | 0x6         |

| UTRSTATn                  | Bit | Description  | Initial State |
|---------------------------|-----|--|---------------|
| Transmitter empty         | [2] | Set to 1 automatically when the transmit buffer register has no valid data to transmit and the transmit shift register is empty.<br>0 = Not empty<br>1 = Transmitter (transmit buffer & shifter register) empty  | 1             |
| Transmit buffer empty     | [1] | Set to 1 automatically when transmit buffer register is empty.<br>0 = The buffer register is not empty<br>1 = Empty<br>(In Non-FIFO mode, Interrupt or DMA is requested.<br>In FIFO mode, Interrupt or DMA is requested, when Tx FIFO Trigger Level is set to 00 (Empty))<br>If the UART uses the FIFO, users should check Tx FIFO Count bits and Tx FIFO Full bit in the UFSTAT register instead of this bit. | 1             |
| Receive buffer data ready | [0] | Set to 1 automatically whenever receive buffer register contains valid data, received over the RXDn port.<br>0 = Empty<br>1 = The buffer register has a received data<br>(In Non-FIFO mode, Interrupt or DMA is requested)<br>If the UART uses the FIFO, users should check Rx FIFO Count bits and Rx FIFO Full bit in the UFSTAT register instead of this bit.  | 0             |

### 3.6 UART ERROR STATUS REGISTER

There are four UART Rx error status registers including UERSTAT0, UERSTAT1, UERSTAT2 and UERSTAT3 in the UART block.

| Register | Address    | R/W | Description                             | Reset Value |
|----------|------------|-----|---|-------------|
| UERSTAT0 | 0x50000014 | R   | UART channel 0 Rx error status register | 0x0         |
| UERSTAT1 | 0x50004014 | R   | UART channel 1 Rx error status register | 0x0         |
| UERSTAT2 | 0x50008014 | R   | UART channel 2 Rx error status register | 0x0         |
| UERSTAT3 | 0x5000C014 | R   | UART channel 3 Rx error status register | 0x0         |

| UERSTATn      | Bit | Description   | Initial State |
|---------------|-----|---|---------------|
| Break Detect  | [3] | Set to 1 automatically to indicate that a break signal has been received.<br>0 = No break receive<br>1 = Break receive (Interrupt is requested.)                        | 0             |
| Frame Error   | [2] | Set to 1 automatically whenever a frame error occurs during receive operation.<br>0 = No frame error during receive<br>1 = Frame error (Interrupt is requested.)        | 0             |
| Parity Error  | [1] | Set to 1 automatically whenever a parity error occurs during receive operation.<br>0 = No parity error during receive<br>1 = Parity error (Interrupt is requested.)     | 0             |
| Overrun Error | [0] | Set to 1 automatically whenever an overrun error occurs during receive operation.<br>0 = No overrun error during receive<br>1 = Overrun error (Interrupt is requested.) | 0             |

**NOTE:** These bits (UERSTATn[3:0]) are automatically cleared to 0 when the UART error status register is read.

### 3.7 UART FIFO STATUS REGISTER

There are four UART FIFO status registers including UFSTAT0, UFSTAT1 UFSTAT2 and UFSTAT3 in the UART block.

| Register | Address    | R/W | Description                         | Reset Value |
|----------|------------|-----|-------------------------------------|-------------|
| UFSTAT0  | 0x50000018 | R   | UART channel 0 FIFO status register | 0x00        |
| UFSTAT1  | 0x50004018 | R   | UART channel 1 FIFO status register | 0x00        |
| UFSTAT2  | 0x50008018 | R   | UART channel 2 FIFO status register | 0x00        |
| UFSTAT3  | 0x5000C018 | R   | UART channel 3 FIFO status register | 0x00        |

| UFSTATn       | Bit    | Description  | Initial State |
|---------------|--------|--|---------------|
| Reserved      | [15]   | –  | 0             |
| Tx FIFO Full  | [14]   | Set to 1 automatically whenever transmit FIFO is full during transmit operation<br>0 = 0-byte ≤ Tx FIFO data ≤ 63-byte<br>1 = Full | 0             |
| Tx FIFO Count | [13:8] | Number of data in Tx FIFO  | 0             |
| Reserved      | [7]    | –  | 0             |
| Rx FIFO Full  | [6]    | Set to 1 automatically whenever receive FIFO is full during receive operation<br>0 = 0-byte ≤ Rx FIFO data ≤ 63-byte<br>1 = Full   | 0             |
| Rx FIFO Count | [5:0]  | Number of data in Rx FIFO  | 0             |

### 3.8 UART MODEM STATUS REGISTER

There are three UART modem status registers including UMSTAT0, UMSTAT1 in the UART block.

| Register | Address    | R/W | Description                          | Reset Value |
|----------|------------|-----|--------------------------------------|-------------|
| UMSTAT0  | 0x5000001C | R   | UART channel 0 modem status register | 0x0         |
| UMSTAT1  | 0x5000401C | R   | UART channel 1 modem status register | 0x0         |
| UMSTAT2  | 0x5000801C | R   | UART channel 2 modem status register | 0x0         |

| UMSTAT0       | Bit   | Description  | Initial State |
|---------------|-------|--|---------------|
| Delta CTS     | [4]   | Indicate that the nCTS input to the S3C2451 has changed state since the last time it was read by CPU.<br>(Refer to Figure 15-8.)<br>0 = Has not changed<br>1 = Has changed | 0             |
| Reserved      | [3:1] | –  | 0             |
| Clear to Send | [0]   | 0 = CTS signal is not activated (nCTS pin is high)<br>1 = CTS signal is activated (nCTS pin is low)  | 0             |

Figure 15-8. nCTS and Delta CTS Timing Diagram

### 3.9 UART TRANSMIT BUFFER REGISTER (HOLDING REGISTER & FIFO REGISTER)

There are four UART transmit buffer registers including UTXH0, UTXH1, UTXH2 and UTXH3 in the UART block. UTXHn has an 8-bit data for transmission data.

| Register | Address    | R/W         | Description                             | Reset Value |
|----------|------------|-------------|---|-------------|
| UTXH0    | 0x50000020 | W (by byte) | UART channel 0 transmit buffer register | –           |
| UTXH1    | 0x50004020 | W (by byte) | UART channel 1 transmit buffer register | –           |
| UTXH2    | 0x50008020 | W (by byte) | UART channel 2 transmit buffer register | –           |
| UTXH3    | 0x5000C020 | W (by byte) | UART channel 3 transmit buffer register | –           |

| UTXHn               | Bit   | Description                         | Initial State |
|---------------------|-------|-------------------------------------|---------------|
| TXDATA <sub>n</sub> | [7:0] | Transmit data for UART <sub>n</sub> | –             |

### 3.10 UART RECEIVE BUFFER REGISTER (HOLDING REGISTER & FIFO REGISTER)

There are four UART receive buffer registers including URXH0, URXH1, URXH2 and URXH3 in the UART block. URXHn has an 8-bit data for received data.

| Register | Address    | R/W         | Description                            | Reset Value |
|----------|------------|-------------|--|-------------|
| URXH0    | 0x50000024 | R (by byte) | UART channel 0 receive buffer register | –           |
| URXH1    | 0x50004024 | R (by byte) | UART channel 1 receive buffer register | –           |
| URXH2    | 0x50008024 | R (by byte) | UART channel 2 receive buffer register | –           |
| URXH3    | 0x5000C024 | R (by byte) | UART channel 3 receive buffer register | –           |

| URXHn               | Bit   | Description                        | Initial State |
|---------------------|-------|------------------------------------|---------------|
| RXDATA <sub>n</sub> | [7:0] | Receive data for UART <sub>n</sub> | –             |

**NOTE:** When an overrun error occurs, the URXHn must be read. If not, the next received data will also make an overrun error, even though the overrun bit of UERSTAT<sub>n</sub> had been cleared.

### 3.11 UART BAUD RATE DIVISOR REGISTER

There are four UART baud rate divisor registers including UBRDIV0, UBRDIV1, UBRDIV2 and UBRDIV3 in the UART block.

| Register | Address    | R/W | Description                                 | Reset Value |
|----------|------------|-----|---|-------------|
| UBRDIV0  | 0x50000028 | R/W | Baud rate divisor(integer place) register 0 | –           |
| UBRDIV1  | 0x50004028 | R/W | Baud rate divisor(integer place) register 1 | –           |
| UBRDIV2  | 0x50008028 | R/W | Baud rate divisor(integer place) register 2 | –           |
| UBRDIV3  | 0x5000C028 | R/W | Baud rate divisor(integer place) register 3 | –           |

| UBRDIVn | Bit    | Description  | Initial State |
|---------|--------|--|---------------|
| UBRDIV  | [15:0] | Baud rate division value of integer part<br>(When UART clock source is PCLK, UBRDIVn must be more than 0 (UBRDIVn >0)) | –             |

**NOTE:** If UBRDIV value is 0, UART baudrate is not affected by UDIVSLOT value.

### 3.12 UART DIVIDING SLOT REGISTER

There are four UART dividing slot registers including UDIVSLOT0, UDIVSLOT 1, UDIVSLOT 2 and UDIVSLOT in the UART block.

| Register  | Address    | R/W | Description                                 | Reset Value |
|-----------|------------|-----|---|-------------|
| UDIVSLOT0 | 0x5000002C | R/W | Baud rate divisor(decimal place) register 0 | 0x0000      |
| UDIVSLOT1 | 0x5000402C | R/W | Baud rate divisor(decimal place) register 1 | 0x0000      |
| UDIVSLOT2 | 0x5000802C | R/W | Baud rate divisor(decimal place) register 2 | 0x0000      |
| UDIVSLOT3 | 0x5000C02C | R/W | Baud rate divisor(decimal place) register 3 | 0x0000      |

| UDIVSLOTn | Bit    | Description                          | Initial State |
|-----------|--------|--------------------------------------|---------------|
| UDIVSLOT  | [15:0] | Select the slot number in Table 15-4 | –             |

**Table 15-4. Recommended Value Table of DIVSLOTn Register**

| Floating point part | Num of 1's | UDIVSLOTn                    |
|---------------------|------------|------------------------------|
| 0                   | 0          | 0x0000(0000_0000_0000_0000b) |
| 0.0625              | 1          | 0x0080(0000_0000_0000_1000b) |
| 0.125               | 2          | 0x0808(0000_1000_0000_1000b) |
| 0.1875              | 3          | 0x0888(0000_1000_1000_1000b) |
| 0.25                | 4          | 0x2222(0010_0010_0010_0010b) |
| 0.3125              | 5          | 0x4924(0100_1001_0010_0100b) |
| 0.375               | 6          | 0x4A52(0100_1010_0101_0010b) |
| 0.4375              | 7          | 0x54AA(0101_0100_1010_1010b) |
| 0.5                 | 8          | 0x5555(0101_0101_0101_0101b) |
| 0.5625              | 9          | 0xD555(1101_0101_0101_0101b) |
| 0.625               | 10         | 0xD5D5(1101_0101_1101_0101b) |
| 0.6875              | 11         | 0xDDD5(1101_1101_1101_0101b) |
| 0.75                | 12         | 0xDDDD(1101_1101_1101_1101b) |
| 0.8125              | 13         | 0xDFDD(1101_1111_1101_1101b) |
| 0.875               | 14         | 0xDFDF(1101_1111_1101_1111b) |
| 0.9375              | 15         | 0xFFDF(1111_1111_1101_1111b) |

**NOTES**

# 16 USB HOST CONTROLLER

## 1 OVERVIEW

S3C2451 supports 2-port USB host interface as follows:

- OHCI Rev 1.0 compatible
- USB Rev1.1 compatible
- Two down stream ports
- Support for both LowSpeed and FullSpeed USB devices

Figure 16-1. USB Host Controller Block Diagram

## 1.1 USB HOST CONTROLLER SPECIAL REGISTERS

The S3C2451 USB host controller complies with OHCI Rev 1.0. Refer to Open Host Controller Interface Rev 1.0 specification for detail information.

**Table 16-1. OHCI Registers for USB Host Controller**

| Register           | Base Address | R/W | Description              | Reset Value         |
|--------------------|--------------|-----|--------------------------|---------------------|
| HcRevision         | 0x49000000   | –   | Control and status group | –                   |
| HcControl          | 0x49000004   | –   |                          | –                   |

# 17

## USB 2.0 FUNCTION

### 1 OVERVIEW

The Samsung USB 2.0 Controller is designed to aid the rapid implementation of the USB 2.0 peripheral device. The controller supports both High and Full speed mode. Using the standard UTMI interface and AHB interface the USB 2.0 Controller can support up to 9 Endpoints (including Endpoint0) with programmable Interrupt, Bulk mode.

#### 1.1 FEATURE

- Compliant to USB 2.0 specification
- Supports FS/HS dual mode operation
- EP 0 FIFO: 64 bytes.
- EP 1/2/3/4 FIFO: 512 bytes double buffering
- EP 5/6/7/8 FIFO: 1024 bytes double buffering
- Convenient Debugging
- Support Interrupt, Bulk, Transfer

2 BLOCK DIAGRAM

Figure 17-1. USB2.0 Block Diagram

USB2.0 Function has a AHB Slave which provides the microcontroller with read and write access to the Control and Status Registers. And also Function has an AHB Master to enable the link to transfer data on the AHB. The S3C2451 USB system shown as Figure 17-1, can be configured as following :

1. USB 1.1 Host 1 Port & USB 2.0 Device 1 Port
2. USB 1.1 Host 2 Ports

### 3 TO ACTIVATE USB PORT1 FOR USB 2.0 FUNCTION

USB Function block of S3C2451 shares USB PORT1 with USB Host block. To activate USB PORT1 for USB Function, see USB control registers in System Controller Guide

Figure 17-2. USB2.0 Function Block Diagram

#### **4 SIE (SERIAL INTERFACE ENGINE)**

This block handles NRZI decoding/encoding, CRC generation and checking, and bit-stuffing. It also provides the interface signals for USB Transceiver.

#### **5 UPH (UNIVERSAL PROTOCOL HANDLER)**

This block includes state machines and FIFO control, control/status register and DMA control block of each direction endpoint.

#### **6 UTMI (USB 2.0 TRANSCEIVER MACROCELL INTERFACE)**

UTMI interface block connects 16 bit data bus and control signals to USB 2.0 PHY.

## 7 USB 2.0 FUNCTION CONTROLLER SPECIAL REGISTERS

The USB 2.0 controller includes several 16-bit registers for the endpoint programming and debugging. The registers can be grouped into two categories. Few of the indexed registers are related to endpoint 0, but most of them are utilized for the control and status monitoring of each data endpoint, including FIFO control and packet size configuration. The buffer register for TX/RX data buffering also belong to the indexed register/

The non-indexed registers are mainly used for the control and status checking of the system. The control and status registers of endpoint0 belong to these non-indexed registers.

**Table 17-1. Non-Indexed Registers**

| Register | Address     | R/W | Description                        |
|----------|-------------|-----|------------------------------------|
| IR       | 0x4980_0000 | R/W | Index Register                     |
| EIR      | 0x4980_0004 | R/W | Endpoint Interrupt Register        |
| EIER     | 0x4980_0008 | R/W | Endpoint Interrupt Enable Register |
| FAR      | 0x4980_000C | R   | Function Address Register          |
| EDR      | 0x4980_0014 | R/W | Endpoint Direction Register        |
| TR       | 0x4980_0018 | R/W | Test Register                      |
| SSR      | 0x4980_001C | R/W | System Status Register             |
| SCR      | 0x4980_0020 | R/W | System Control Register            |
| EP0SR    | 0x4980_0024 | R/W | EP0 Status Register                |
| EP0CR    | 0x4980_0028 | R/W | EP0 Control Register               |
| EP0BR    | 0x4980_0060 | R/W | EP0 Buffer Register                |
| EP1BR    | 0x4980_0064 | R/W | EP1 Buffer Register                |
| EP2BR    | 0x4980_0068 | R/W | EP2 Buffer Register                |
| EP3BR    | 0x4980_006C | R/W | EP3 Buffer Register                |
| EP4BR    | 0x4980_0070 | R/W | EP4 Buffer Register                |
| EP5BR    | 0x4980_0074 | R/W | EP5 Buffer Register                |
| EP6BR    | 0x4980_0078 | R/W | EP6 Buffer Register                |
| EP7BR    | 0x4980_007C | R/W | EP7 Buffer Register                |
| EP8BR    | 0x4980_0080 | R/W | EP8 Buffer Register                |
| FCON     | 0x4980_0100 | R/W | Burst FIFO-DMA Control             |
| FSTAT    | 0x4980_0104 | R/W | Burst FIFO status                  |

Table 17-2. Indexed Registers

| Register | Address     | R/W | Description                          |
|----------|-------------|-----|--------------------------------------|
| ESR      | 0x4980_002C | R/W | Endpoints Status Register            |
| ECR      | 0x4980_0030 | R/W | Endpoints Control Register           |
| BRCR     | 0x4980_0034 | R   | Byte Read Count Register             |
| BWCR     | 0x4980_0038 | R/W | Byte Write Count Register            |
| MPR      | 0x4980_003C | R/W | Max Packet Register                  |
| DCR      | 0x4980_0040 | R/W | DMA Control Register                 |
| DTCR     | 0x4980_0044 | R/W | DMA Transfer Counter Register        |
| DFCR     | 0x4980_0048 | R/W | DMA FIFO Counter Register            |
| DTTCR1   | 0x4980_004C | R/W | DMA Total Transfer Counter1 Register |
| DTTCR2   | 0x4980_0050 | R/W | DMA Total Transfer Counter2 Register |
| MICR     | 0x4980_0084 | R/W | Master Interface Control Register    |
| MBAR     | 0x4980_0088 | R/W | Memory Base Address Register         |
| MCAR     | 0x4980_008C | R/W | Memory Current Address Register      |

## 8 REGISTERS

### 8.1 INDEX REGISTER (IR)

The index register is used for indexing a specific endpoint. In most cases, setting the index register value should precede any other operation.

| Register | Address     | R/W | Description    | Reset Value |
|----------|-------------|-----|----------------|-------------|
| IR       | 0x4980_0000 | R/W | Index Register | 0x00        |

| IR    | Bit     | R/W | Description  | Initial State |
|-------|---------|-----|--|---------------|
|       | [31:16] | –   | Reserved   | 0000          |
|       | [15:4]  | –   | Reserved (Don't write to this field)   | 0             |
| INDEX | [3:0]   | R/W | Endpoint Number Select (0~6)<br>0000 = Endpoint0<br>0001 = Endpoint1<br>0010 = Endpoint2<br>0011 = Endpoint3<br>0100 = Endpoint4<br>0101 = Endpoint5<br>0110 = Endpoint6<br>0111 = Endpoint7<br>1000 = Endpoint8 | 0000          |

## 8.2 ENDPOINT INTERRUPT REGISTER (EIR)

The endpoint interrupt register lets the MCU know what endpoint generates the interrupt. The source of an interrupt could be various, but, when an interrupt is detected, the endpoint status register should be checked to identify if it's related to specific endpoint. Clearing the bits can be accomplished by writing "1" to the bit position where the interrupt is detected.

| Register | Address     | R/W | Description                 | Reset Value |
|----------|-------------|-----|-----------------------------|-------------|
| EIR      | 0x4980_0004 | R/C | Endpoint Interrupt Register | 0x00        |

| EIR  | Bit    | R/W | Description               | Initial State |
|------|--------|-----|---------------------------|---------------|
|      | [31:9] | –   | Reserved                  | 0             |
| EP8I | [8]    | R/C | Endpoint 8 Interrupt Flag | 0             |
| EP7I | [7]    | R/C | Endpoint 7 Interrupt Flag | 0             |
| EP6I | [6]    | R/C | Endpoint 6 Interrupt Flag | 0             |
| EP5I | [5]    | R/C | Endpoint 5 Interrupt Flag | 0             |
| EP4I | [4]    | R/C | Endpoint 4 Interrupt Flag | 0             |
| EP3I | [3]    | R/C | Endpoint 3 Interrupt Flag | 0             |
| EP2I | [2]    | R/C | Endpoint 2 Interrupt Flag | 0             |
| EP1I | [1]    | R/C | Endpoint 1 Interrupt Flag | 0             |
| EP0I | [0]    | R/C | Endpoint 0 Interrupt Flag | 0             |

### 8.3 ENDPOINT INTERRUPT ENABLE REGISTER (EIER)

Pairing with interrupt register, this register enables interrupt for each endpoints.

| Register | Address     | R/W | Description                        | Reset Value |
|----------|-------------|-----|------------------------------------|-------------|
| EIER     | 0x4980_0008 | R/W | Endpoint interrupt enable register | 0x00        |

| EIER  | Bit    | R/W | Description   | Initial State |
|-------|--------|-----|---|---------------|
|       | [31:9] | –   | Reserved  |               |
| EP8IE | [8]    | R/W | Endpoint 8 Interrupt Enable Flag  | 0             |
| EP7IE | [7]    | R/W | Endpoint 7 Interrupt Enable Flag  | 0             |
| EP6IE | [6]    | R/W | Endpoint 6 Interrupt Enable Flag  | 0             |
| EP5IE | [5]    | R/W | Endpoint 5 Interrupt Enable Flag  | 0             |
| EP4IE | [4]    | R/W | Endpoint 4 Interrupt Enable Flag  | 0             |
| EP3IE | [3]    | R/W | Endpoint 3 Interrupt Enable Flag  | 0             |
| EP2IE | [2]    | R/W | Endpoint 2 Interrupt Enable Flag  | 0             |
| EP1IE | [1]    | R/W | Endpoint 1 Interrupt Enable Flag  | 0             |
| EP0IE | [0]    | R/W | Endpoint 0 Interrupt Enable Flag<br>1 = EP0 Interrupt flag enable<br>0 = EP0 Interrupt flag disable | 0             |

#### 8.4 FUNCTION ADDRESS REGISTER (FAR)

This register holds the address of USB device.

| Register | Address     | R/W | Description               | Reset Value |
|----------|-------------|-----|---------------------------|-------------|
| FAR      | 0x4980_000C | R   | Function address register | 0x0         |

| FAR | Bit    | R/W | Description  | Initial State |
|-----|--------|-----|--|---------------|
|     | [31:7] | –   | Reserved   |               |
| FA  | [6:0]  | R   | MCU can read a unique USB function address from this register. The address is transferred from USB Host through “set_address” command. | 7'h0          |

## 8.5 ENDPOINT DIRECTION REGISTER (EDR)

USB 2.0 Core supports IN/OUT direction control for each endpoint. This direction can't be changed dynamically. Only by new enumeration, the direction can be altered. Since the endpoint 0 is bi-directional, there is no direction bit assigned to it.

| Register | Address     | R/W | Description                 | Reset Value |
|----------|-------------|-----|-----------------------------|-------------|
| EDR      | 0x4980_0014 | R/W | Endpoint direction register | 0x0         |

| EDR   | Bit    | R/W | Description   | Initial State |
|-------|--------|-----|---|---------------|
|       | [31:9] | –   | Reserved  |               |
| EP8DS | [8]    | R/W | Endpoint 8 Direction Select                                       | 0             |
| EP7DS | [7]    | R/W | Endpoint 7 Direction Select                                       | 0             |
| EP6DS | [6]    | R/W | Endpoint 6 Direction Select                                       | 0             |
| EP5DS | [5]    | R/W | Endpoint 5 Direction Select                                       | 0             |
| EP4DS | [4]    | R/W | Endpoint 4 Direction Select                                       | 0             |
| EP3DS | [3]    | R/W | Endpoint 3 Direction Select                                       | 0             |
| EP2DS | [2]    | R/W | Endpoint 2 Direction Select                                       | 0             |
| EP1DS | [1]    | R/W | Endpoint 1 Direction Select<br>0 = Rx Endpoint<br>1 = Tx Endpoint | 0             |
|       | [0]    | –   | Reserved  |               |

## 8.6 TEST REGISTER (TR)

The test register is used for the diagnostics. All bit are activated when 1 is written to and is cleared by 0 on them. Bit[3:0] are for the high speed device only.

| Register | Address     | R/W | Description   | Reset Value |
|----------|-------------|-----|---------------|-------------|
| TR       | 0x4980_0018 | R/W | Test register | 0x0         |

| TR   | Bit    | R/W | Description  | Initial State |
|------|--------|-----|--|---------------|
|      | [31:5] | –   | Reserved   |               |
| TMD  | [4]    | R/W | Test Mode.<br>When TMD is set to 1. The core is forced into the test mode. Following TPS, TKS, TJS, TSNS bits are meaningful in test mode.   | 0             |
| TPS  | [3]    | R/W | Test Packets.<br>If this bit is set, the USB repetitively transmit the test packets to Host.<br>The test packets are explained in 7.1.20 of USB 2.0 specification.<br>This bit can be set when TMD bit is set. | 0             |
| TKS  | [2]    | R/W | Test K Select.<br>If this bit is set, the transceiver port enters into the high-speed K state.<br>This bit can be set when TMD bit is set.   | 0             |
| TJS  | [1]    | R/W | Test J Select.<br>If this bit is set, the transceiver port enters into the high-speed J state.<br>This bit can be set when TMD bit is set.   | 0             |
| TSNS | [0]    | R/W | Test SE0 NAK Select<br>If this bit is set, the transceiver enters into the high speed receive mode and must respond to any IN token with NAK handshake.<br>This bit can be set when TMD bit is set.            | 0             |

## 8.7 SYSTEM STATUS REGISTER (SSR)

This register reports operational status of the USB 2.0 Function Core, especially about error status and power saving mode status. Except the line status, every status bits in the System Status Register could be an interrupt sources. When the register is read after an interrupt due to certain system status changes, MCU should write back 1 to the corresponding bits to clear it.

| Register | Address     | R/W | Description   | Reset Value |
|----------|-------------|-----|---------------|-------------|
| SSR      | 0x4980_001C | R/C | Test register | 0x0         |

| SSR   | Bit     | R/W | Description  | Initial State |
|-------|---------|-----|--|---------------|
|       | [31:16] | –   | Reserved   |               |
| BAERR | [15]    | R/C | Byte Align Error<br>If error interrupt enable bit of SCR register is set to 1, BAERR is set to 1 when byte alignment error is detected.            | 0             |
| TMERR | [14]    | R/C | Timeout Error<br>If error interrupt enable bit of SCR register is set to 1, TMERR is set to 1 when timeout error is detected.                      | 0             |
| BSERR | [13]    | R/C | Bit Stuff Error<br>If error interrupt enable bit of SCR register is set to 1, BSERR is set to 1 when bit stuff error is detected.                  | 0             |
| TCERR | [12]    | R/C | Token CRC Error<br>If error interrupt enable bit of SCR register is set to 1, BSERR is set to 1 when CRC error in token packet is detected.        | 0             |
| DCERR | [11]    | R/C | Data CRC Error<br>If error interrupt enable bit of SCR register is set to 1, DCERR is set to 1 when CRC error in data packet is detected.          | 0             |
| EOERR | [10]    | R/C | EB OVERRUN Error<br>If error interrupt enable bit of SCR register is set to 1, EOERR is set to 1 when EB overrun error in transceiver is detected. | 0             |
|       | [9:8]   | –   | Reserved   |               |
| TBM   | [7]     | R/C | Toggle Bit Mismatch.<br>If error interrupt enable bit of SCR register is set to 1, TBM is set to 1 when Toggle mismatch is detected.               | 0             |
| DP    | [6]     | R   | DP Data Line State<br>DP informs the status of D+ Line   | 0             |
| DM    | [5]     | R   | DM Data Line State<br>DM informs the status of D- Line   | 0             |
| HSP   | [4]     | R   | Host Speed<br>0 = Full Speed<br>1 = High Speed   | 0             |

| SSR    | Bit | R/W | Description  | Initial State |
|--------|-----|-----|--|---------------|
| SDE    | [3] | R/C | Speed Detection End.<br>SDE is set by the core when the HS Detect Handshake process is ended.      | 0             |
| HFRM   | [2] | R/C | Host Forced Resume.<br>HFRM is set by the core in suspend state when host sends resume signaling.  | 0             |
| HFSUSP | [1] | R/C | Host Forced Suspend<br>HFSUSP is set by the core when the SUSPEND signaling from host is detected. | 0             |
| HFRES  | [0] | R/C | Host Forced Reset.<br>HFRES is set by the core when the RESET signaling from host is detected.     | 0             |

## 8.8 SYSTEM CONTROL REGISTER (SCR)

This register enables top-level control of the core. MCU should access this register for controls such as Power saving mode enable/disable.

| Register | Address     | R/W | Description             | Reset Value |
|----------|-------------|-----|-------------------------|-------------|
| SCR      | 0x4980_0020 | R/W | System control register | 0x0         |

| SCR    | Bit     | R/W | Description   | Initial State |
|--------|---------|-----|---|---------------|
|        | [31:15] | –   | Reserved  |               |
| DTZIEN | [14]    | R/W | DMA Total Counter Zero Interrupt Enable<br>0 = Disable<br>1 = Enable<br>When set to 1, DMA total counter zero interrupt is generated.   | 0             |
|        | [13]    | –   | Reserved  |               |
| DIEN   | [12]    | R/W | DUAL Interrupt Enable<br>0 = Disable<br>1 = Enable<br>When set to 1, Interrupt is activated until Interrupt source is cleared.  | 0             |
|        | [11:9]  | –   | Reserved  |               |
| EIE    | [8]     | R/W | Error Interrupt Enable<br>This bit must be set to 1 to enable error interrupt.  | 0             |
| SPDCEN | [7]     | R/W | Speed detection Control Enable<br>0 = Disable<br>1 = Enable   | 0             |
| SPDEN  | [6]     | R/W | Speed Detect End Interrupt Enable<br>When set to 1, Speed detection interrupt is generated.   | 0             |
|        | [5]     | –   | Reserved  |               |
|        | [4]     | –   | Should be zero  | 0             |
| SPDC   | [3]     | R/W | Speed detection Control<br>Software can reset Speed detection Logic through this bit.<br>This bit is used to control speed detection process in case of System with a long initial time.<br>0 = Enable<br>1 = Disable | 0             |
| MFRM   | [2]     | R/W | Resume by MCU<br>If this bit is set, the suspended core generates a resume signal. This bit is set when MCU writes 1. This bit is cleared when MCU writes 0.  | 0             |
| HSUSPE | [1]     | R/W | Suspend Enable<br>When set to 1, core can respond to the suspend signaling by USB host.   | 0             |
| HRESE  | [0]     | R/W | Reset Enable<br>When set to 1, core can respond to the reset signaling by USB host.   | 0             |

### 8.9 EP0 STATUS REGISTER (EP0SR)

This register stores status information of the Endpoint 0. These status information are set automatically by the core when corresponding conditions are met. After reading the bits, MCU should write 1 to clear them.

| Register | Address     | R/W | Description         | Reset Value |
|----------|-------------|-----|---------------------|-------------|
| EP0SR    | 0x4980_0024 | R/W | EP0 status register | 0x0         |

| EP0SR | Bit    | R/W | Description   | Initial State |
|-------|--------|-----|---|---------------|
|       | [31:7] | –   | Reserved  |               |
| LWO   | [6]    | R   | Last Word Odd<br>Low informs that the last word of a packet in FIFO has an invalid upper byte.<br>This bit is cleared automatically after the MCU reads it from the FIFO.               | 0             |
|       | [5]    | –   | Reserved  |               |
| SHT   | [4]    | R/C | Stall Handshake Transmitted.<br>SHT informs that STALL handshake due to stall condition is sent to Host.<br>This bit is an interrupt source. This bit is cleared when the MCU writes 1. | 0             |
|       | [3:2]  | –   | Reserved  |               |
| TST   | [1]    | R/C | Tx successfully received.<br>TST is set by core after core sends TX data to Host and receives ACK successfully. TST is one of the interrupt sources.                                    | 0             |
| RSR   | [0]    | R/C | Rx successfully received.<br>RSR is set by core after core receives error free packet from Host and sent ACK back to Host successfully.<br>RSR is one of the interrupt sources.         | 0             |

### 8.10 EP0 CONTROL REGISTER (EP0CR)

EP0 control register is used for the control of endpoint 0. Controls such as enabling ep0 related interrupts and toggle controls can be handled by EP0 control register.

| Register | Address     | R/W | Description          | Reset Value |
|----------|-------------|-----|----------------------|-------------|
| EP0CR    | 0x4980_0028 | R/W | EP0 control register | 0x0         |

| EP0CR | Bit    | R/W | Description   | Initial State |
|-------|--------|-----|---|---------------|
|       | [31:2] | –   | Reserved  |               |
| ESS   | [1]    | R/W | Endpoint Stall Set<br>ESS is set by MCU when it intends to send STALL handshake to Host.<br>This bit is cleared when the MCU writes 0 on it.<br>ESS is needed to be set 0 after MCU writes 1 on it.   | 0             |
| TZLS  | [0]    | R/W | Tx Zero Length Set.<br>TZLS is set by MCU when it intends to send Tx zero length data to Host.<br>TZLS is useful for core Test.<br>TZLS can be managed when Tx Test Enable (TTE) bit is set.<br>This bit is cleared when the MCU writes 0 on it | 0             |

**8.11 ENDPOINT# BUFFER REGISTER (EP#BR)**

The buffer register is used to hold data for TX/RX transfer.

| Register | Address     | R/W | Description         | Reset Value |
|----------|-------------|-----|---------------------|-------------|
| EP0BR    | 0x4980_0060 | R/W | EP0 Buffer Register | 0x0         |
| EP1BR    | 0x4980_0064 | R/W | EP1 Buffer Register | 0x0         |
| EP2BR    | 0x4980_0068 | R/W | EP2 Buffer Register | 0x0         |
| EP3BR    | 0x4980_006C | R/W | EP3 Buffer Register | 0x0         |
| EP4BR    | 0x4980_0070 | R/W | EP4 Buffer Register | 0x0         |
| EP5BR    | 0x4980_0074 | R/W | EP5 Buffer Register | 0x0         |
| EP6BR    | 0x4980_0078 | R/W | EP6 Buffer Register | 0x0         |
| EP7BR    | 0x4980_007C | R/W | EP7 Buffer Register | 0x0         |
| EP8BR    | 0x4980_0080 | R/W | EP8 Buffer Register | 0x0         |

| EP#BR | Bit     | R/W | Description   | Initial State |
|-------|---------|-----|---|---------------|
|       | [31:16] | –   | Reserved  |               |
|       | [15:0]  | R/W | Buffer register holds TX/RX data between MCU and the core | 16hX          |

## 8.12 ENDPOINT STATUS REGISTER (ESR)

The endpoint status register reports current status of an endpoint (except EP0) to the MCU

| Register | Address     | R/W | Description              | Reset Value |
|----------|-------------|-----|--------------------------|-------------|
| ESR      | 0x4980_002C | R/W | Endpoint status register | 0x0         |

| ESR  | Bit     | R/W | Description  | Initial State |
|------|---------|-----|--|---------------|
|      | [31:12] |     | Reserved   |               |
| FPID | [11]    | R/W | First OUT Packet interrupt Disable in OUT DMA operation.<br>First Received OUT packet generates interrupt if this bit is disabled and DEN in DMA control register is enabled<br>0 = Disable<br>1 = Enable                              | 0             |
| OSD  | [10]    | R/C | OUT Start DMA Operation.<br>OSD is set when First OUT packet is received after Registers related DMA Operation are set.  | 0             |
| DTCZ | [9]     | R/C | DMA Total Count Zero<br>DTCZ is set when DMA Operation Total Counter reach to 0.<br>This bit is cleared when the MCU writes 1 on it.   | 0             |
| SPT  | [8]     | R/C | Short Packet Received.<br>SPT informs that OUT endpoint receives short packet during OUT DMA Operation.<br>This bit is cleared when the MCU writes 1 on it.  | 0             |
| DOM  | [7]     | R   | Dual Operation Mode<br>DOM is set when the max packet size of corresponding endpoint is equal to a half FIFO size.<br>This bit is read only.<br>Endpoint0 does not support dual mode.  | 0             |
| FFS  | [6]     | R/C | FIFO Flushed.<br>FFS informs that FIFO is flushed.<br>This bit is an interrupt source.<br>This bit is cleared when the MCU clears FLUSH bit in Endpoint Control Register.  | 0             |
| FSC  | [5]     | R/C | Function Stall Condition.<br>FSC informs that STALL handshake due to functional stall condition is sent to Host.<br>This bit is set when endpoint stall set bit is set by the MCU.<br>This bit is cleared when the MCU writes 1 on it. | 0             |
| LWO  | [4]     | R   | Last Word Odd.<br>Low informs that the lower byte of last word is only valid.<br>This bit is automatically cleared after the MCU reads packet data received Host.  | 0             |

| ESR  | Bit   | R/W | Description   | Initial State |
|------|-------|-----|---|---------------|
| PSIF | [3:2] | R   | Packet Status In FIFO.<br>00 = No packet in FIFO<br>01 = One packet in FIFO<br>10 = Two packet in FIFO<br>11 = Invalid value  | 0             |
| TPS  | [1]   | R/C | Tx Packet Success<br>TPS is used for Single or Dual transfer mode.<br>TPS is activated when one packet data in FIFO was successfully transferred to Host and received ACK from Host.<br>This bit should be cleared by writing 1 on it after being read by the MCU.                            | 0             |
| RPS  | [0]   | R   | Rx Packet Success.<br>RPS is used for Single or Dual transfer mode.<br>RPS is activated when the FIFO has a packet data to receive. RPS is automatically cleared when MCU reads all packets (one or two) from FIFO. MCU can identify the packet size through byte read count register (BRCR). | 0             |

### 8.13 ENDPOINT CONTROL REGISTER (ECR)

The endpoint control register is useful for controlling an endpoint both in normal operation and test case. Putting an endpoint in specific operation mode can be accomplished through the endpoint control register.

| Register | Address     | R/W | Description               | Reset Value |
|----------|-------------|-----|---------------------------|-------------|
| ECR      | 0x4980_0030 | R/W | Endpoint Control Register | 0x0         |

| ECR       | Bit     | R/W | Description   | Initial State |
|-----------|---------|-----|---|---------------|
|           | [31:13] | –   | Reserved  |               |
| INPKTHLD  | [12]    | R/W | The MCU can control Tx FIFO status through this bit. If this bit is set to one, USB does not send IN data to Host.<br>0 = The USB can send IN data to Host according to IN FIFO status(normal operation)<br>1 = The USB sends NAK handshake to Host regardless of IN FIFO status. | 0             |
| OUTPKTHLD | [11]    | R/W | The MCU can control Rx FIFO Status through this bit. If this bit is set to one, USB does not accept OUT data from Host.<br>0 = The USB can accept OUT data from Host according to OUT FIFO status(normal operation)<br>1 = The USB does not accept OUT data from Host.            | 0             |
|           | [10:8]  | –   | Reserved  |               |
| DUEN      | [7]     | R/W | Dual FIFO mode Enable<br>0 = Dual Disable(Single mode)<br>1 = Dual Enable   | 0             |
| FLUSH     | [6]     | R/W | FIFO Flush<br>FIFO is flushed when this bit is set to 1.<br>This bit is automatically cleared after MCU writes 1.   | 0             |
|           | [5:2]   | –   | Reserved  |               |
| ESS       | [1]     | R/W | Endpoint Stall Set<br>ESS is set by the MCU when the MCU intends to send STALL handshake to Host.<br>This bit is cleared when the MCU writes 0 in it.   | 0             |
| IEMS      | [0]     | R/W | Interrupt Endpoint Mode Set<br>IEMS determines the transfer type of an endpoint.<br>0 = Interrupt Transfer mode Disable<br>1 = Interrupt Transfer mode Enable   | 0             |

#### 8.14 BYTE READ COUNT REGISTER (BRCR)

The byte read count register keeps byte (half word) counts of a RX packet from USB host.

| Register | Address     | R/W | Description              | Reset Value |
|----------|-------------|-----|--------------------------|-------------|
| BRCR     | 0x4980_0034 | R   | Byte Read Count Register | 0x0         |

| BRCR  | Bit     | R/W | Description   | Initial State |
|-------|---------|-----|---|---------------|
|       | [31:10] | –   | Reserved  |               |
| RDCNT | [9:0]   | R   | FIFO Read Byte Count[9:0] RDCNT is read only. The BRCR inform the amount of received data from host.<br>In 16-bit Interface, RDCNT informs the amount of data in half word (16-bit) unit. Through the LWO bit of EP0SR, the MCU can determine valid byte in last data word. | 10'h          |

### 8.15 BYTE WRITE COUNT REGISTER (BWCR)

The byte write count register keeps the byte (half word) count value of a TX packet from MCU. The counter value will be used to determine the end of TX packet.

| Register | Address     | R/W | Description               | Reset Value |
|----------|-------------|-----|---------------------------|-------------|
| BWCR     | 0x4980_0038 | R/W | Byte Write Count Register | 0x0         |

| BWCR  | Bit     | R/W | Description  | Initial State |
|-------|---------|-----|--|---------------|
|       | [31:10] | –   | Reserved   |               |
| WRCNT | [9:0]   | R/W | Through BWCR, the MCU must load the byte counts of a TX data packet to the core. The core uses this count value to determine the end of packet. The count value to this register must be less than MAXP. | 10'h          |

**8.16 MAX PACKET REGISTER (MPR)**

The byte write count register keeps the byte (half word) count value of a TX packet from MCU. The counter value will be used to determine the end of TX packet.

| Register | Address     | R/W | Description         | Reset Value |
|----------|-------------|-----|---------------------|-------------|
| MPR      | 0x4980_003C | R/W | MAX Packet Register | 0x0         |

| MPR  | Bit     | R/W | Description  | Initial State |
|------|---------|-----|--|---------------|
|      | [31:11] | –   | Reserved   |               |
| MAXP | [10:0]  | R/W | MAX Packet [10:0]<br>The max packet size of each endpoint is determined by MAX packet register. The range of max packet is from 0 to 1024 bytes.<br>000_0000_0000 = Max Packet 0 byte.<br>000_0000_1000 = Max Packet 8 bytes.<br>000_0001_0000 = Max Packet 16 bytes.<br>000_0010_0000 = Max Packet 32 bytes.<br>000_0100_0000 = Max Packet 64 bytes.<br>000_1000_0000 = Max Packet 128 bytes.<br>001_0000_0000 = Max Packet 256 bytes.<br>010_0000_0000 = Max Packet 512 bytes.<br>100_0000_0000 = Max Packet 1024 bytes. | 11'h0         |

### 8.17 DMA CONTROL REGISTER (DCR)

The AHB Master Operation is controlled by the programming DMA Control Register and DMA IF Control Register.

| Register | Address     | R/W | Description          | Reset Value |
|----------|-------------|-----|----------------------|-------------|
| DCR      | 0x4980_0040 | R/W | DMA Control Register | 0x0         |

| DCR   | Bit    | R/W | Description   | Initial State |
|-------|--------|-----|---|---------------|
|       | [31:6] | –   | Reserved  |               |
| ARDRD | [5]    | R/W | Auto Rx DMA Run set disable.<br>0 = Set<br>1 = Disable<br>This bit is cleared when DMA operation is ended.  | 0             |
| FMDE  | [4]    | R/W | Burst Mode Enable.<br>This bit is used to run Burst Mode DMA Operation.<br>0 = Burst mode disable<br>1 = Burst mode enable  | 0             |
| DMDE  | [3]    | R/W | Demand Mode DMA Enable.<br>This bit is used to run Demand mode DMA operation.<br>0 = Demand mode disable.<br>1 = Demand mode enable.  | 0             |
| TDR   | [2]    | R/W | Tx DMA Operation Run<br>This bit is used to set start DMA operation for Tx Endpoint (IN endpoint)<br>0 = DMA operation stop<br>1 = DMA operation run  | 0             |
| RDR   | [1]    | R/W | Rx DMA Operation Run<br>This bit is used to start DMA operation for Rx Endpoint (OUT endpoint).<br>This bit is automatically set when USB receives OUT packet data and DEN bit is set to 1 and ARDRD bit is set to 0.<br>To operate DMA operation after OUT packet data received, MCU must set RDR to 1.<br>0 = DMA operation stop.<br>1 = DMA operation run. | 0             |
| DEN   | [0]    | R/W | DMA Operation Mode Enable<br>This bit is used to set the DMA Operation mode<br>0 = Interrupt Operation mode<br>1 = DMA Operation mode   | 0             |

### 8.18 DMA TRANSFER COUNTER REGISTER (DTCR)

The byte write count register keeps the byte (half word) count value of a TX packet from MCU. The counter value will be used to determine the end of TX packet.

| Register | Address     | R/W | Description                   | Reset Value |
|----------|-------------|-----|-------------------------------|-------------|
| DTCR     | 0x4980_0044 | R/W | DMA Transfer Counter Register | 0x0         |

| MTCR | Bit     | R/W | Description   | Initial State |
|------|---------|-----|---|---------------|
|      | [31:11] |     | Reserved  |               |
| DTCR | [10:0]  | R/W | To operate single mode transfer, DTCR is needed to be set 11'h0002. In case of Burst mode, the MCU should set max packet value. | 11'h0         |

### 8.19 DMA FIFO COUNTER REGISTER (DFCR)

This register has the byte number of data per DMA operation.  
The max packet size is loaded in this register.

| Register | Address     | R/W | Description               | Reset Value |
|----------|-------------|-----|---------------------------|-------------|
| DFCR     | 0x4980_0048 | R/W | DMA FIFO Counter Register | 0x0         |

| MFCR | Bit     | R/W | Description  | Initial State |
|------|---------|-----|--|---------------|
|      | [31:12] | –   | Reserved   |               |
| DFCR | [11:0]  | R/W | In case of OUT Endpoint, the size value of received packet will be loaded in this register automatically when Rx DMA Run is enabled.<br>In case of IN Endpoint, the MCU should set max packet value. | 12'h0         |

**8.20 DMA TOTAL TRANSFER COUNTER REGISTER 1/2 (DTTCR 1/2)**

This register has the total byte number of data to transfer using DMA Interface.  
When this counter register value is zero, DMA operation is ended.

| Register         | Address                    | R/W | Description                             | Reset Value |
|------------------|----------------------------|-----|---|-------------|
| DTTCR1<br>DTTCR2 | 0x4980_004C<br>0x4980_0050 | R/W | DMA Total Transfer Counter Register 1/2 | 0x0         |

| MTTCR# | Bit     | R/W | Description   | Initial State |
|--------|---------|-----|---|---------------|
|        | [31:16] |     | Reserved  |               |
| DTTCR  | [15:0]  | R/W | This register should have total byte size to be transferred using DMA Interface.<br><br>DMA Total Transfer Counter1<br>: Low half word value<br><br>DMA Total Transfer Counter2<br>: High half word value.<br><br>The max value is up to $2^{32}$ | 16'h0         |

## 8.21 DMA INTERFACE CONTROL REGISTER (DICR)

The AHB Master Operation is controlled by the programming DMA Control Register and DMA IF Control Register.

| Register | Address     | R/W | Description                    | Reset Value |
|----------|-------------|-----|--------------------------------|-------------|
| DICR     | 0x4980_0084 | R/W | DMA Interface Counter Register | 0x0         |

| DICR        | Bit    | R/W | Description  | Initial State |
|-------------|--------|-----|--|---------------|
| Reserved    | [31:4] | –   | Reserved   | 0             |
| RELOAD_MBAR | [4]    | R/W | Select Reload Condiion<br>0 = Every end of Full DMA operation<br>1 = Every Packet transfer.  | 0             |
| Reserved    | [3:2]  |     | Reserved   | 0             |
| MAX_BURST   | [1:0]  | R/W | Max Burst Length<br>00 = Single transfer<br>01 = 4-beat incrementing burst transfer(INCR4)<br>10 = 8-beat incrementing burst transfer(INCR8)<br>11 = 16-beat incrementing burst transfer(INCR16) | 00            |

**8.22 MEMORY BASE ADDRESS REGISTER (MBAR)**

| Register | Address     | R/W | Description                  | Reset Value |
|----------|-------------|-----|------------------------------|-------------|
| MBAR     | 0x4980_0088 | R/W | Memory Base Address Register | 0x0         |

| MBAR# | Bit    | R/W | Description  | Initial State |
|-------|--------|-----|--|---------------|
| MBAR  | [31:0] | R/W | This register should have memory base address to be transferred using DMA Interface. | 32'h0         |

**8.23 MEMORY CURRENT ADDRESS REGISTER (MCAR)**

| Register | Address     | R/W | Description                     | Reset Value |
|----------|-------------|-----|---------------------------------|-------------|
| MCAR     | 0x4980_008C | R   | Memory Current Address Register | 0x0         |

| MCAR# | Bit    | R/W | Description   | Initial State |
|-------|--------|-----|---|---------------|
| MCAR  | [31:0] | R   | This register should have memory current address to be transferred using DMA Interface. |               |

**8.24 BURST FIFO CONTROL REGISTER(FCON)**

| Register | Address     | R/W | Description                | Reset Value |
|----------|-------------|-----|----------------------------|-------------|
| FCON     | 0x4980_0100 | R/W | Burst DMA transfer Control | 0x0         |

Figure 17-4. IN Transfer Operation Flow

## NOTES

# 18 IIC-BUS INTERFACE

## 1 OVERVIEW

The S3C2451 RISC microprocessor can support two channels of multi-master IIC-bus serial interface. A dedicated serial data line (SDA) and a serial clock line (SCL) carry information between bus masters and peripheral devices which are connected to the IIC-bus. The SDA and SCL lines are bi-directional.

In multi-master IIC-bus mode, multiple S3C2451 RISC microprocessors can receive or transmit serial data to or from slave devices. The master S3C2451 can initiate and terminate a data transfer over the IIC-bus. The IIC-bus in the S3C2451 uses Standard bus arbitration procedure.

To control multi-master IIC-bus operations, values must be written to the following registers:

- Multi-master IIC-bus control register, IICCON
- Multi-master IIC-bus control/status register, IICSTAT
- Multi-master IIC-bus Tx/Rx data shift register, IICDS
- Multi-master IIC-bus address register, IICADD

When the IIC-bus is free, the SDA and SCL lines should be both at High level. A High-to-Low transition of SDA can initiate a Start condition. A Low-to-High transition of SDA can initiate a Stop condition while SCL remains steady at High Level.

The Start and Stop conditions can always be generated by the master devices. A 7-bit address value in the first data byte, which is put onto the bus after the Start condition has been initiated, can determine the slave device which the bus master device has selected. The 8th bit determines the direction of the transfer (read or write).

Every data byte put onto the SDA line should be eight bits in total. The bytes can be unlimitedly sent or received during the bus transfer operation. Data is always sent from most-significant bit (MSB) first, and every byte should be immediately followed by acknowledge (ACK) bit.

Figure 18-1. IIC-Bus Block Diagram

## 1.1 IIC-BUS INTERFACE

The S3C2451 IIC-bus interface has four operation modes:

- Master transmitter mode
- Master receive mode
- Slave transmitter mode
- Slave receive mode

Functional relationships among these operating modes are described below.

## 1.2 START AND STOP CONDITIONS

When the IIC-bus interface is inactive, it is usually in Slave mode. In other words, the interface should be in Slave mode before detecting a Start condition on the SDA line (a Start condition can be initiated with a High-to-Low transition of the SDA line while the clock signal of SCL is High). When the interface state is changed to Master mode, a data transfer on the SDA line can be initiated and SCL signal generated.

A Start condition can transfer a one-byte serial data over the SDA line, and a Stop condition can terminate the data transfer. A Stop condition is a Low-to-High transition of the SDA line while SCL is High. Start and Stop conditions are always generated by the master. The IIC-bus gets busy when a Start condition is generated. A Stop condition will make the IIC-bus free.

When a master initiates a Start condition, it should send a slave address to notify the slave device. One byte of address field consists of a 7-bit address and a 1-bit transfer direction indicator (showing write or read). If bit 8 is 0, it indicates a write operation (transmit operation); if bit 8 is 1, it indicates a request for data read (receive operation).

The master will complete the transfer operation by transmitting a Stop condition. If the master wants to continue the data transmission to the bus, it should generate another Start condition as well as a slave address. In this way, the read-write operation can be performed in various formats.

Figure 18-2. Start and Stop Condition

### 1.3 DATA TRANSFER FORMAT

Every byte placed on the SDA line should be eight bits in length. The bytes can be unlimitedly transmitted per transfer. The first byte following a Start condition should have the address field. The address field can be transmitted by the master when the IIC-bus is operating in Master mode. Each byte should be followed by an acknowledgement (ACK) bit. The MSB bit of the serial data and addresses are always sent first.

Figure 18-3. IIC-Bus Interface Data Format

Figure 18-4. Data Transfer on the IIC-Bus

1.4 ACK SIGNAL TRANSMISSION

To complete a one-byte transfer operation, the receiver should send an ACK bit to the transmitter. The ACK pulse should occur at the ninth clock of the SCL line. Eight clocks are required for the one-byte data transfer. The master should generate the clock pulse required to transmit the ACK bit.

The transmitter should release the SDA line by making the SDA line High when the ACK clock pulse is received. The receiver should also drive the SDA line Low during the ACK clock pulse so that the SDA keeps Low during the High period of the ninth SCL pulse.

The ACK bit transmit function can be enabled or disabled by software (IICSTAT). However, the ACK pulse on the ninth clock of SCL is required to complete the one-byte data transfer operation.

Figure 18-5. Acknowledge on the IIC-Bus

### 1.5 READ-WRITE OPERATION

In Transmitter mode, when the data is transferred, the IIC-bus interface will wait until IIC-bus Data Shift (IICDS) register receives a new data. Before the new data is written into the register, the SCL line will be held low, and then released after it is written. The S3C2451 should hold the interrupt to identify the completion of current data transfer. After the CPU receives the interrupt request, it should write a new data into the IICDS register, again.

In Receive mode, when data is received, the IIC-bus interface will wait until IICDS register is read. Before the new data is read out, the SCL line will be held low and then released after it is read. The S3C2451 should hold the interrupt to identify the completion of the new data reception. After the CPU receives the interrupt request, it should read the data from the IICDS register.

### 1.6 BUS ARBITRATION PROCEDURES

Arbitration takes place on the SDA line to prevent the contention on the bus between two masters. If a master with a SDA High level detects the other master with a SDA active Low level, it will not initiate a data transfer because the current level on the bus does not correspond to its own. The arbitration procedure will be extended until the SDA line turns High.

However, when the masters simultaneously lower the SDA line, each master should evaluate whether the mastership is allocated itself or not. For the purpose of evaluation is that each master should detect the address bits. While each master generates the slaver address, it should also detect the address bit on the SDA line because the SDA line is likely to get Low rather than to keep High. Assume that one master generates a Low as first address bit, while the other master is maintaining High. In this case, both masters will detect Low on the bus because the Low status is superior to the High status in power. When this happens, Low (as the first bit of address) generating master will get the mastership while High (as the first bit of address) generating master should withdraw the mastership. If both masters generate Low as the first bit of address, there should be arbitration for the second address bit, again. This arbitration will continue to the end of last address bit.

### 1.7 ABORT CONDITIONS

If a slave receiver cannot acknowledge the confirmation of the slave address, it should hold the level of the SDA line High. In this case, the master should generate a Stop condition and to abort the transfer.

If a master receiver is involved in the aborted transfer, it should signal the end of the slave transmit operation by canceling the generation of an ACK after the last data byte received from the slave. The slave transmitter should then release the SDA to allow a master to generate a Stop condition.

### 1.8 CONFIGURING IIC-BUS

To control the frequency of the serial clock (SCL), the 4-bit prescaler value can be programmed in the IICCON register. The IIC-bus interface address is stored in the IIC-bus address (IICADD) register. (By default, the IIC-bus interface address has an unknown value.)

### 1.9 FLOWCHARTS OF OPERATIONS IN EACH MODE

The following steps must be executed before any IIC Tx/Rx operations.

1. Write own slave address on IICADD register, if needed.
2. Set IICCON register.
  - a) Enable interrupt
  - b) Define SCL period
3. Set IICSTAT to enable Serial Output

## 2 IIC-BUS INTERFACE SPECIAL REGISTERS

### 2.1 MULTI-MASTER IIC-BUS CONTROL (IICCON) REGISTER

| Register | Address    | R/W | Description               | Reset Value |
|----------|------------|-----|---------------------------|-------------|
| IICCON0  | 0x54000000 | R/W | IIC0-Bus control register | 0x0X        |
| IICCON1  | 0x54000100 | R/W | IIC1-Bus control register | 0x0X        |

| IICCON0<br>IICCON1                             | Bit   | Description   | Initial State |
|--|-------|---|---------------|
| Acknowledge generation<br>(note 1)             | [7]   | IIC-bus acknowledge enable bit.<br>0 = Disable<br>1 = Enable<br><br>In Tx mode, the IICSDA is free in the ack time.<br>In Rx mode, the IICSDA is L in the ack time.   | 0             |
| Tx clock source selection                      | [6]   | Source clock of IIC-bus transmit clock prescaler selection bit.<br>0 = IICCLK = PCLK /16<br>1 = IICCLK = PCLK /512  | 0             |
| Tx/Rx Interrupt<br>(note 5)                    | [5]   | IIC-Bus Tx/Rx interrupt enable/disable bit.<br>0 = Disable, 1 = Enable  | 0             |
| Interrupt pending flag<br>(note 2)<br>(note 3) | [4]   | IIC-bus Tx/Rx interrupt pending flag. This bit cannot be written to 1.<br>When this bit is read as 1, the IICSDA is tied to L and the IIC is stopped. To resume the operation, clear this bit as 0.<br><br>0 = 1) No interrupt pending (when read).<br>2) Clear pending condition &<br>Resume the operation (when write).<br><br>1 = 1) Interrupt is pending (when read)<br>2) N/A (when write) | 0             |
| Transmit clock value<br>(note 4)               | [3:0] | IIC-Bus transmit clock prescaler.<br><br>IIC-Bus transmit clock frequency is determined by this 4-bit prescaler value, according to the following formula:<br>Tx clock = IICCLK/(IICCON[3:0]+1).  | Undefined     |

#### NOTES:

- Interfacing with EEPROM, the ack generation may be disabled before reading the last data in order to generate the STOP condition in Rx mode.
- An IIC-bus interrupt occurs 1) when a 1-byte transmits or receives operation is completed, 2) when a general call or a slave address match occurs, or 3) if bus arbitration fails.
- To adjust the setup time of SDA before SCL rising edge, IICDSS has to be written before clearing the IIC interrupt pending bit.
- IICCLK is determined by IICCON[6].  
Tx clock can vary by SCL transition time.  
When IICCON[6]=0, IICCON[3:0]=0x0 or 0x1 is not available.
- If the IICCON[5]=0, IICCON[4] does not operate correctly.  
So, It is recommended that you should set IICCON[5]=1, although you does not use the IIC interrupt.

## 2.2 MULTI-MASTER IIC-BUS CONTROL/STATUS (IICSTAT) REGISTER

| Register | Address    | R/W | Description                      | Reset Value |
|----------|------------|-----|----------------------------------|-------------|

| SDA output delay | [1:0] | IIC-Bus SDA line delay length selection bits.<br>SDA line is delayed as following clock time(PCLK)<br>00 = 0 clocks<br>01 = 5 clocks<br>10 = 10 clocks<br>11 = 15 clocks   | 00            |

# 19 <sub>2D</sub>

## 1 INTRODUCTION

2D graphics accelerator supports three types of primitive drawings: Line/Point Drawing, Bit Block Transfer (BitBLT) and Color Expansion (Text Drawing).

Rendering a primitive takes two steps: 1) configure the rendering parameters, such as foreground color and the coordinate data, by setting the drawing-context registers; 2) start the rendering process by setting the relevant command registers accordingly.

### 1.1 FEATURES

#### 1.1.1 Primitives

- Line/Point Drawing
  - DDA ( Digital Differential Analyzer) algorithm
  - Do-Not-Draw Last Point support
- BitBLT
  - Stretched BitBLT support ( Nearest sampling )
  - Memory to Screen
  - Host to Screen
- Color Expansion
  - Memory to Screen
  - Host to Screen

#### 1.1.2 Per-pixel Operation

- Maximum 2040\*2040 image size
- Window Clipping
- 90°/180°/270°/X-flip/Y-flip Rotation
- Totally 256 3-operand Raster Operation (ROP)
- Alpha Blending
  - Alpha Blending with a user-specified 256-level alpha value
  - Per-pixel Alpha Blending
- 8x8x16-bpp pattern drawing

#### 1.1.3 Data Format

- 16/24/32-bpp color format support
- 11.11 fixed point format for coordinate data

## 2 COLOR FORMAT CONVERSION

2D supports seven color formats: RGB\_565, RGBA\_5551, ARGB\_1555, RGBA\_8888, ARGB\_8888, XRGB\_8888, and RGBX\_8888. The structure of each color format is illustrated in Figure 19-1.

**Figure 19-1. Color Format**

The internal computations use ARGB\_8888 format. All data (source, destination, foreground, background, blue-screen, pattern) are converted to ARGB\_8888 format before computation, and the final result are converted to the color format specified by DEST\_COLOR\_MODE\_REG before writing to frame buffer.

When a 16-bit color data is converted to 32-bit, the data of each field is shifted  $(8 - x)$  bits to left, where  $x$  is the bit-width of the field. The least significant  $x$  bits of the new field data are padded with the most significant  $x$  bits of the original field data. For example, if the R value in RGB\_565 format is 5'b11010, it will be converted to 8'b11010110, with three LSBs padded with three MSBs (3'b110) from the original R value. Note that, the A field in RGBA\_5551 and ARGB\_1555 only has one bit, so it is converted to either 8'b00000000 or 8'b11111111 (A=1'b1).

When a 32-bit color data is converted to 16-bit, the data of each field is truncated to  $x$  bits, where  $x$  is the bit-width of the field in the new color format. For example, if the R value in RGBA\_8888 format is 8'b11001110, it will be converted to 5'b11001 in the RGB\_565 format, with the three LSBs discarded. Note that, if the A field of the 32-bit color data is not 0, the A field in RGBA\_5551 and ARGB\_1555 will be 1'b1; otherwise, 1'b0.

### 3 COMMAND FIFO

2D has a 32-word command FIFO. Every data written to command registers and parameter setting registers will be written to the FIFO first. If the graphics engine is idle (no command is being executed), the data will be written to the designated register in one cycle; otherwise, the data will be stored in the FIFO and wait to be dispatched after the current rendering process completes.

It is user's responsibility to make sure that the data written to the FIFO do not exceed its maximum capacity. User can monitor the number of data entries used in FIFO by reading FIFO\_USED bits in FIFO\_STAT\_REG, or ask graphics engine to give an interrupt signal when the number of entries in FIFO reaches a certain level by setting FIFO\_INTC\_REG and E bit in INTEN\_REG.

## 4 RENDERING PIPELINE

The rendering pipeline of 2D is illustrated in Figure 19-2. The functionality and related registers of each stage are introduced in detail in the rest of this chapter.

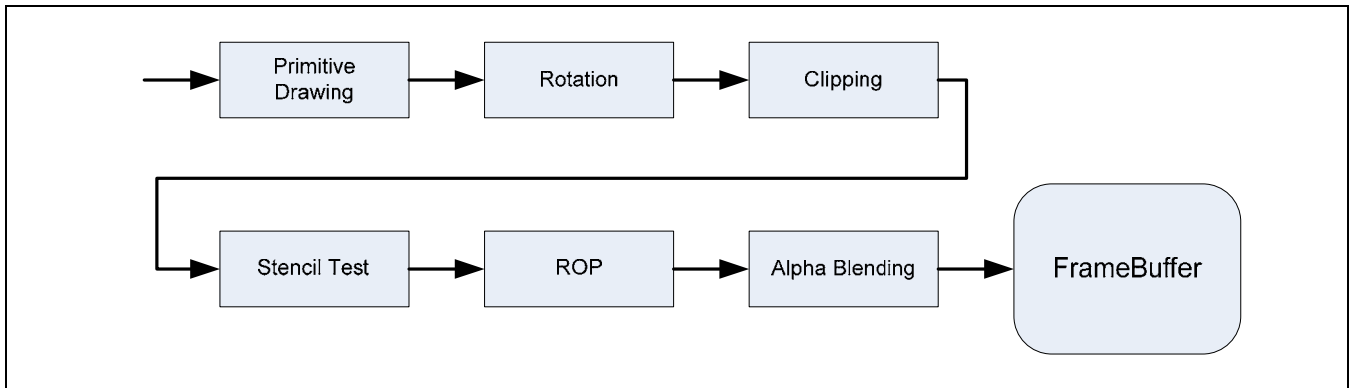

Figure 19-2. 2D Rendering Pipeline

### 4.1 PRIMITIVE DRAWING

Primitive Drawing determines the pixels to fill, and pass their coordinates to the next stage for further operations.

2D supports three types of primitive drawing: 1) line/point drawing; 2) bit block transfer; 3) color expansion.

#### 4.1.1 Line/Point Drawing

Line Drawing renders a line between the starting point (sx, sy) and the ending point (ex, ey) specified by the user. If the distance of these two points along y axis is greater than that along x axis ( $|ey - sy| > |ex - sx|$ ), the Major Axis should be set to y-axis; otherwise, x-axis. If y-axis is the Major Axis, the y-coordinate of a pixel on the line is increased or decreased by 1 from its preceding pixel, while the x-coordinate increased or decreased by X-INCR (smaller than 1). In the same vein, if x-axis is the Major Axis, the x-coordinate is increased or decreased by 1 while the y-coordinate by Y-INCR. Note that X-INCR and Y-INCR should be given in 2's complement format as shown below.

Figure 19-3. Data Format

#### 4.1.2 Related Registers

| COORD_0  | Coordinate of the starting point  |
|----------|---|
| COORD_2  | Coordinate of the ending point (ignored if a point is rendered).  |
| X-INCR   | X increment value ( ignored if x-axis is the Major Axis or a point is rendered).<br>$X-INCR = (ex-sx)/  ey - sy $   |
| Y-INCR   | Y increment value (ignored if y-axis is the Major Axis or a point is rendered).<br>$Y-INCR = (ey - sy)/  ex - sx $  |
| FG_COLOR | The color of the drawn line/point   |
| CMD0_REG | Configure the line/point drawing parameters, such as whether the Major-Axis is x-axis or y-axis, whether to draw a line or a point, and so on. Note that writing to this register starts the rendering process. |

#### 4.1.3 Bit Block Transfer

A Bit Block Transfer is a transformation of a rectangular block of pixels. Typical applications include copying the off-screen pixel data to frame buffer, combining to bitmap patterns by Raster Operation, changing the dimension of a rectangular image and so on.

#### 4.1.4 On-Screen Rendering

On-screen bit block transfer copies a rectangular block of pixels on screen to another position on the same screen. Note that on-screen rendering has the following restriction:

- 1) SRC\_BASE\_ADDR = DEST\_BASE\_ADDR
- 2) SRC\_HORI\_RES\_REG = DEST\_HORI\_RES\_REG
- 3) SRC\_COLOR\_MODE = DEST\_COLOR\_MODE
- 4) If the destination block overlaps with the source block, stretch mode and rotation must not be used.

#### 4.1.5 Off-Screen Rendering

Off-screen bit block transfer copies pixel data from off-screen memory to frame buffer. Color space conversion is performed automatically if SRC\_COLOR\_MODE differs from DEST\_COLOR\_MODE. YUV 4:2:2 input is also supported.

#### 4.1.6 Transparent Mode

2D can render image in Transparent Mode. In this mode, the pixels having the same color with background color (BG\_COLOR) are discarded, resulting in a transparent effect. The function of Transparent Mode is illustrated in the images below, in which the BG\_COLOR is set to white.

Figure 19-4. Transparent Mode

2D supports both host-to-screen mode and memory-to-screen mode of BLT.

#### 4.1.7 Known Issue

In the stretch mode (when source image is scaled), the source coordinates are always rounded to the nearest. This rounding may cause some problem in the boundary when users try to scale the image by integer times. For example, if user wants to scale the image by four times, and set the X\_INCR as 0.25, the source coordinates in sequence are 0, 0.25, 0.50, 0.75, 1.0 and so on. However, when the current source coordinate is 0.75, it is rounded to the nearest integer, which is 1, so the first pixel only repeats three times instead of four times. Such problem may not be an issue when both the source and destination are big pictures or when the scale is not an integer, but when it comes to small icons or when user wants every pixel to repeat exactly integer times, an obvious error will occur.

## 4.1.8 Related Registers

|                     |  |
|---------------------|--|
| COORD_0             | Coordinate of the leftmost topmost coordinate of the source image  |
| COORD_1             | Coordinate of the rightmost bottommost coordinate of the source image  |
| COORD_2             | Coordinate of the leftmost topmost coordinate of the destination image   |
| COORD_3             | Coordinate of the rightmost bottommost coordinate of the destination image   |
| X-INCR              | X increment value of the source image coordinates. If it is greater than 1, the image is shrunk horizontally; smaller than 1, stretched. This value is ignored when S bit in CMDR_1 is disabled or host-to-screen mode is used.<br>$X\_INCR = (COORD1\_X - COORD0\_X) / (COORD3\_X - COORD2\_X)$   |
| Y-INCR              | Y increment value of the source image coordinates. If it is greater than 1, the image is shrunk vertically; smaller than 1, stretched. This value is ignored when S bit in CMDR_1 is disabled or host-to-screen mode is used.<br>$Y\_INCR = (COORD1\_Y - COORD0\_Y) / (COORD3\_Y - COORD2\_Y)$   |
| SRC_BASE_ADDR       | The base address of the source image (when memory-to-screen mode is used).   |
| DEST_BASE_ADDR      | The base address of the destination image (usually the frame buffer base address)  |
| SRC_HORI_RES_REG    | The horizontal resolution of the source image  |
| SRC_VERT_RES_REG    | The vertical resolution of the source image (used in YUV mode)   |
| SC_HORI_RES_REG     | The screen resolution  |
| SRC_COLOR_MODE      | The color mode of the source image   |
| DEST_COLOR_MODE     | The color mode of the destination image  |
| BG_COLOR            | Background color, used in the Transparent Mode and Blue Screen Mode.   |
| BS_COLOR            | Blue screen color, used in the Blue Screen Mode.   |
| ROP_REG             | Enable/disable Transparent Mode or Blue Screen Mode.   |
| CMD1_REG            | Writing to this register starts the rendering process of memory-to-screen Bit Block Transfer. If S bit is set, the image will be shrunk or stretched, depending on the values of X-INCR and Y-INCR.  |
| CMD2_REG / CMD3_REG | The host provides the source image data through these two command registers. When the host writes the first 32-bit data into CMD2_REG, the rendering process starts in the host-to-screen mode. Then the host should provide the rest of data by writing into CMD3_REG continuously. Note that the data written to CMD2_REG/CMD3_REG each time represents only one pixel, regardless of the source color format. If the source color format is 16-bpp (e.g., RGB565), the upper 16 bits of the data are ignored. |

### 4.1.9 Color Expansion (Font Drawing)

Color Expansion expands the monochrome color to either background (BG\_COLOR) or foreground (FG\_COLOR) color. Each bit of the source data presents a pixel, with '1' indicating the foreground color and '0' the background color. The bit sequence is from MSB to LSB. The MSB of the first data corresponds to the leftmost topmost pixel of the destination image. Figure 19-5 serves as a good illustration of the function and data type of Color Expansion. In this example, the foreground color is blue and background white, and the destination image is 16-pixel wide.

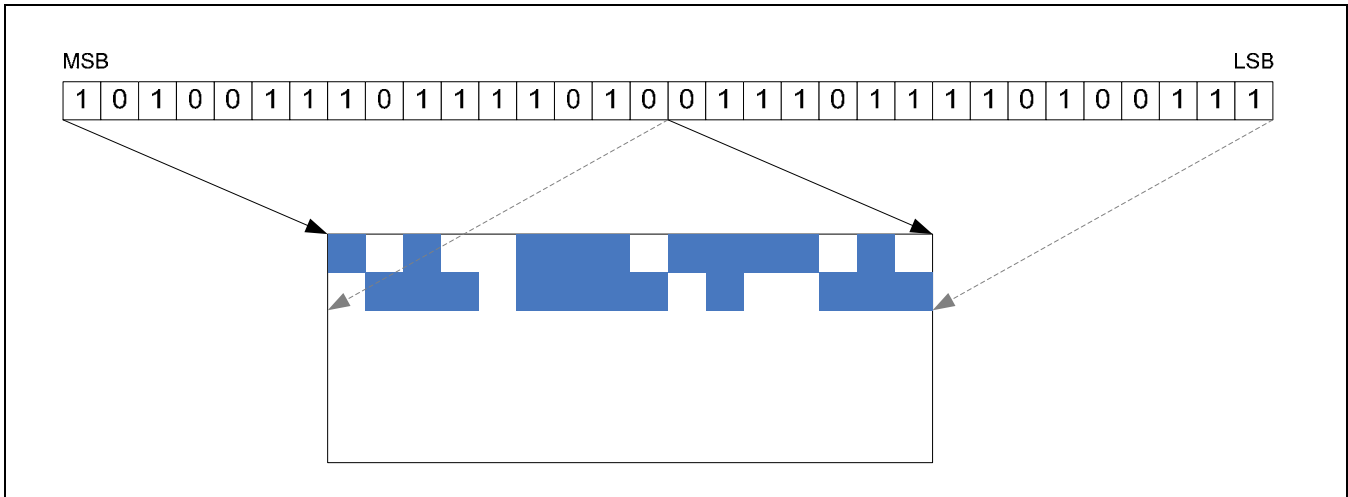

Figure 19-5. Color Expansion

2D can render Color Expansion image in Transparent Mode. In this mode, the pixels with background color (the corresponding bits are '0's) are discarded, resulting in a transparent effect. The transparent effect on Color Expansion is illustrated in Figure 19-6, in which the lower three lines are drawn with Transparent Mode enabled while the upper three disabled. Note that the background color is set to white and the foreground black.

Figure 19-6. Font Drawing with Transparent Mode

2D supports both host-to-screen mode and memory-to-screen mode of Color Expansion.

#### 4.1.10 Related Registers

|                   |   |
|-------------------|---|
| COORD_0           | Coordinate of the leftmost topmost coordinate of the destination window   |
| COORD_1           | Coordinate of the rightmost bottommost coordinate of the destination window   |
| FG_COLOR          | Foreground Color  |
| BG_COLOR          | Background Color  |
| ROP_REG           | Enable/disable Transparent Mode   |
| CMD7_REG          | The base address of the font data. Note that writing to this register starts the rendering process in the memory-to-screen mode.  |
| CMD4_REG/CMD5_REG | The host provides the font data through these two command registers. When the host writes the first 32-bit data into CMD4_REG, the rendering process starts in the host-to-screen mode. Then the host should provide the rest of data by writing them into CMD5_REG continuously. |

## 4.2 ROTATION

The pixels can be rotated around the reference point (ox, oy) by 90/180/270 degree clockwise or perform a X-axis/Y-axis flip around the horizontal or vertical line on which (ox, oy) lies. The effects of all rotation options are summarized in the following table and illustrated in Figure 19-7.

### 4.2.1 Related Registers

|            |  |
|------------|--|
| ROT_OC_REG | Coordinate of the rotation reference point |
| ROTATE_REG | Rotation mode configuration                |

## 4.2.2 Rotation Effect

|   | 0°  | 90°            | 180°       | 270°           | X-flip     | Y-flip     |
|---|-----|----------------|------------|----------------|------------|------------|
| x | dcx | -dcy + (ox+oy) | -dcx + 2ox | dcy + (ox-oy)  | dcx        | -dcx + 2ox |
| y | dcy | dcx - (ox-oy)  | -dcy + 2oy | -dcx + (ox+oy) | -dcy + 2oy | dcy        |

Figure 19-7. Rotation Example

### 4.3 CLIPPING

Clipping discards the pixels (after rotation) outside the clipping window. The discarded pixels will not go through the rest of rendering pipelines.

Note that the clipping windows must reside totally inside the screen. Setting the clipping window the same size with the screen will disable the clipping effect, and a clipping window bigger than the screen size is not allowed.

#### 4.3.1 Related Registers

|           |   |
|-----------|---|
| CW_LT_REG | Coordinate of the leftmost topmost point of the clipping window     |
| CW_RB_REG | Coordinate of the rightmost bottommost point of the clipping window |

### 4.4 STENCIL TEST

The Stencil Test conditionally discards a pixel based on the outcome of a comparison between the color value of this pixel of the source image and the DR(min)/DR(max) values. If each field (R, G, B, A) of the color value falls in the range of [ DR(min), DR(max)], this pixel is passed to the next stage; otherwise, discarded. User can disable the stencil test on a specific field by clearing the corresponding bits in COLORKEY\_CNTL. Note that each field of DR\_MIN and DR\_MAX is 8-bit wide, regardless of the source color mode setting.

#### 4.4.1 Related Registers

|                 |   |
|-----------------|---|
| COLORKEY_CNTL   | Stencil Test configurations, such as enable/disable the test and so on. |
| COLORKEY_DR_MIN | Set the DR(min) value for each field                                    |
| COLORKEY_DR_MAX | Set the DR(max) value for each field                                    |

### 4.5 RASTER OPERATION

Raster Operation performs Boolean operations on three operands: source, destination and third operand according to the 8-bit ROP value specified by the user. The truth table of ROP is given in the following table.

| Source | Destination | Third Operand | ROP Value |
|--------|-------------|---------------|-----------|
| 0      | 0           | 0             | Bit0      |
| 0      | 0           | 1             | Bit1      |
| 0      | 1           | 0             | Bit2      |
| 0      | 1           | 1             | Bit3      |
| 1      | 0           | 0             | Bit4      |
| 1      | 0           | 1             | Bit5      |
| 1      | 1           | 0             | Bit6      |
| 1      | 1           | 1             | Bit7      |

The third operand can be pattern or foreground color, configurable by the OS bit in the ROP\_REG.

Pattern is a user-specified 8x8x16-bpp image; the pattern data should be given in RGB565 format. The following equation is used to calculate the pattern index of pixel (x, y):

$$\text{index} = ((\text{patternOffsetY} + y) \& 0x7) \ll 3 + ((\text{patternOffsetX} + x) \& 0x7),$$

where patternOffsetY and patternOffsetX are the offset value specified in register PATOFF\_REG.

Here are some examples on how to use the ROP value to perform the operations:

1. Final Data = Source. Only the Source data matter, so ROP Value = "11110000".
2. Final Data = Destination. Only the Destination data matter, so ROP Value = "11001100".
3. Final Data = Pattern. Only the Pattern data matter, so ROP Value = "10101010".
4. Final Data = Source AND Destination. ROP Value = "11110000" & "11001100" = "11000000"
5. Final Data = Source OR Pattern. ROP Value = "11110000" | "10101010" = "11111010".

Note that the Raster Operation only applies on R, G, B fields of the color data; the A field will not be affected.

#### 4.5.1 Related Registers

|                   |                                  |
|-------------------|----------------------------------|
| PATTERN_REG[0:31] | Pattern data                     |
| PATOFF_REG        | Pattern offset X, Y              |
| ROP_REG           | ROP configurations and ROP Value |

## 4.6 ALPHA BLENDING

Alpha Blending combines the source color and the destination color in the frame buffer to get the new destination color.

The conventional alpha blending equation is:  $\text{final data} = \text{src} * \text{alpha} + \text{dest} * (1.0 - \text{alpha})$ . 2D uses 8-bit integer to represent the alpha value, with 0 indicating 1/256 and 255 indicating 1.0. The equation of converting 8-bit ALPHA value to the actual fractional alpha value is:  $\text{alpha} = (\text{ALPHA}+1) / 256$ .

The internal computation of alpha blending and fading is as follows:

User-specified alpha value: ALPHA (given by ALPHA\_REG, from 0 to 255)

[Alpha Blending]  
 $\text{data} = (\text{source} * (\text{ALPHA}+1) + \text{destination} * (255-\text{ALPHA})) \gg 8$

[Fading]  
 $\text{data} = ((\text{source} * (\text{ALPHA}+1)) \gg 8) + \text{fading offset}$

Per-pixel alpha blending: ALPHA (given by the source image, from 0 to 255)

[Alpha Blending]  
 $\text{data} = (\text{source} * (\text{ALPHA}+1) + \text{destination} * (255-\text{ALPHA})) \gg 8$

[Fading]  
 $\text{data} = ((\text{source} * (\text{ALPHA}+1)) \gg 8) + \text{fading offset}$

### 4.6.1 Related Registers

|           |   |
|-----------|---|
| ROP_REG   | Alpha blending configurations: alpha blending disable/enable, per-pixel alpha blending disable/enable, fading disable/enable. |
| ALPHA_REG | Alpha value and fading value.   |

## 5 REGISTER DESCRIPTIONS

| Register                           | Offset | R/W | Description   | Reset Value |
|------------------------------------|--------|-----|---|-------------|
| <b>General Registers</b>           |        |     |   |             |
| CONTROL_REG                        | 0x0000 | W   | Control register.   | 0x0000_0000 |
| INTEN_REG                          | 0x0004 | R/W | Interrupt Enable register.  | 0x0000_0000 |
| FIFO_INTC_REG                      | 0x0008 | R/W | Interrupt Control register.   | 0x0000_0018 |
| INTC_PEND_REG                      | 0x000C | R/W | Interrupt Control Pending register.                                   | 0x0000_0000 |
| FIFO_STAT_REG                      | 0x0010 | R   | Command FIFO Status register.   | 0x0000_0600 |
| <b>Command Registers</b>           |        |     |   |             |

## 5.1 GENERAL REGISTERS

### 5.1.1 Control Register (CONTROL\_REG)

| Register    | Address    | R/W | Description      | Reset Value |
|-------------|------------|-----|------------------|-------------|
| CONTROL_REG | 0x4D408000 | W   | Control register | 0x0         |

| Field    | Bit    | Description  | Initial State |
|----------|--------|--|---------------|
| Reserved | [31:1] | –  | 0x0           |
| R        | [0]    | Software Reset<br>Write to this bit results in a one-cycle reset signal to FIMG2D graphics engine. Every command register and parameter setting register will be assigned the “Reset Value”, and the command FIFO will be cleared. | 0x0           |

### 5.1.2 Interrupt Enable Register (INTEN\_REG)

| Register  | Address    | R/W | Description               | Reset Value |
|-----------|------------|-----|---------------------------|-------------|
| INTEN_REG | 0x4D408004 | R/W | Interrupt Enable register | 0x0         |

| Field      | Bit     | Description  | Initial State |
|------------|---------|--|---------------|
| Reserved   | [31:11] | –  | 0x0           |
| CCF        | [10]    | Current Command Finished interrupt enable.<br>If this bit is set, when the graphics engine finishes the execution of current command, an interrupt occurs, and the INTP_CMD_FIN flag in INTC_PEND_REG will be set.                                 |               |
| ACF        | [9]     | All Commands Finished interrupt enable.<br>If this bit is set, when the graphics engine finishes the execution of all commands in the command FIFO, an interrupt occurs, and the INTP_ALL_FIN flag in INTC_PEND_REG will be set.                   | 0x0           |
| FIFO_FULL  | [8]     | Command FIFO Full interrupt enable.<br>If this bit is set, when command FIFO is full (32 entries), an interrupt occurs, and the INTP_FULL flag in the interrupt pending register (INTC_PEND_REG) will be set.                                      | 0x0           |
| Reserved   | [7:1]   | –  | 0x0           |
| FIFO_INT_E | [0]     | If this bit is set, when the number of entries occupied in command FIFO is greater or equal to FIFO_INT_LEVEL (in FIFO_INTC_REG), an interrupt occurs, and the INTP_FIFO_LEVEL flag in the interrupt pending register (INTC_PEND_REG) will be set. | 0x0           |

### 5.1.3 FIFO Interrupt Control Register (FIFO\_INTC\_REG)

| Register      | Address    | R/W | Description            | Reset Value |
|---------------|------------|-----|------------------------|-------------|
| FIFO_INTC_REG | 0x4D408008 | R/W | FIFO Interrupt Control | 0x18        |

| Field          | Bit    | Description  | Initial State |
|----------------|--------|--|---------------|
| Reserved       | [31:6] | –  | 0x0           |
| FIFO_INT_LEVEL | [5:0]  | If FIFO_INT_E (in INTEN_REG) is set, when FIFO_USED (in FIFO_STAT_REG) is greater or equal to FIFO_INT_LEVEL, an interrupt occurs. | 0x18          |

### 5.1.4 Interrupt Pending Register (INTC\_PEND\_REG)

| Register      | Address    | R/W | Description                | Reset Value |
|---------------|------------|-----|----------------------------|-------------|
| INTC_PEND_REG | 0x4D40800C | R/W | Interrupt Pending Register | 0x0         |

| Field           | Bit     | Description   | Initial State |
|-----------------|---------|---|---------------|
| Reserved        | [31]    | Should be set '1'   | –             |
| Reserved        | [30:11] | Reserved  | –             |
| INTP_CMD_FIN    | [10]    | Current Command Finished interrupt flag.<br>Writing '1' to this bit clears this flag.         | –             |
| INTP_ALL_FIN    | [9]     | All Commands Finished interrupt flag.<br>Writing '1' to this bit clears this flag.            | –             |
| INTP_FULL       | [8]     | Command FIFO Full interrupt flag.<br>Writing '1' to this bit clears this flag.                | –             |
| Reserved        | [7:1]   | –   | –             |
| INTP_FIFO_LEVEL | [0]     | FIFO_USED reaches FIFO_INT_LEVEL interrupt flag.<br>Writing '1' to this bit clears this flag. | –             |

### 5.1.5 FIFO Status Register (FIFO\_STAT\_REG)

| Register      | Address    | R/W | Description          | Reset Value |
|---------------|------------|-----|----------------------|-------------|
| FIFO_STAT_REG | 0x4D408010 | R   | FIFO Status Register | 0x600       |

| Field          | Bit     | Description   | Initial State |
|----------------|---------|---|---------------|
| Reserved       | [31:11] | –   | –             |
| CMD_FIN        | [10]    | 1 = The graphics engine finishes the execution of current command.<br>0 = In the middle of rendering process.   | 0x1           |
| ALL_FIN        | [9]     | 1 = Graphics engine is in idle state. The graphics engine finishes the execution of all commands in the command FIFO. Note that ALL_FIN = CMD_FIN && (FIFO_USED==0).<br>0 = In the middle of rendering process, or FIFO_USED is greater than 0. | 0x1           |
| FIFO_OVERFLOW  | [8]     | 1 = Command FIFO is full, no more commands can be handled<br>0 = Command FIFO is not full.  | 0x0           |
| Reserved       | [7]     | –   | –             |
| FIFO_USED      | [6:1]   | The number of entries occupied in command FIFO.   | 0x0           |
| FIFO_LEVEL_INT | [0]     | 1 = FIFO_USED is greater or equal to FIFO_INT_LEVEL<br>0 = FIFO_USED is smaller than FIFO_INT_LEVEL   | 0x0           |

## 5.2 COMMAND REGISTERS

### 5.2.1 LINE Drawing Register (CMD0\_REG)

| Register | Address    | R/W | Description           | Reset Value |
|----------|------------|-----|-----------------------|-------------|
| CMD0_REG | 0x4D408100 | W   | Line Drawing Register | 0x0         |

| Field    | Bit     | Description  | Initial State |
|----------|---------|--|---------------|
| Reserved | [31:10] | –  | –             |
| D        | [9]     | 0 = Draw Last Point<br>1 = Do-not-Draw Last Point. | –             |
| M        | [8]     | 0 = Major axis is Y.<br>1 = Major axis is X.       | –             |
| Reserved | [7:2]   | –  | –             |
| L        | [1]     | 0 = Nothing.<br>1 = Line Drawing.                  | –             |
| P        | [0]     | 0 = Nothing.<br>1 = Point Drawing.                 | –             |

### 5.2.2 BitBLT Register (CMD1\_REG)

| Register | Address    | R/W | Description     | Reset Value |
|----------|------------|-----|-----------------|-------------|
| CMD1_REG | 0x4D408104 | W   | BitBLT Register | 0x0         |

| Field    | Bit    | Description                       | Initial State |
|----------|--------|-----------------------------------|---------------|
| Reserved | [31:2] | –                                 | –             |
| S        | [1]    | 0 = Nothing<br>1 = Stretch BitBLT | –             |
| N        | [0]    | 0 = Nothing<br>1 = Normal BitBLT  | –             |

### 5.2.3 HOST Screen Start BitBLT Register (CMD2\_REG)

| Register | Address    | R/W | Description                          | Reset Value |
|----------|------------|-----|--------------------------------------|-------------|
| CMD2_REG | 0x4D408108 | W   | Host to Screen Start BitBLT Register | 0x0         |

| Field | Bit    | Description  | Initial State |
|-------|--------|--|---------------|
| Data  | [31:0] | BitBLT data (Start)<br>Note that the data written to this register represents only one pixel, regardless of the source color mode. If the source color mode is 16-bpp (e.g., RGB565), the upper 16 bits of the data are ignored. | –             |

#### 5.2.4 Host to Screen Continue BitBLT Register (CMD3\_REG)

| Register | Address    | R/W | Description                             | Reset Value |
|----------|------------|-----|---|-------------|
| CMD3_REG | 0x4D40810C | W   | Host to Screen Continue BitBLT Register | 0x0         |

| Field | Bit    | Description   | Initial State |
|-------|--------|---|---------------|
| Data  | [31:0] | BitBLT data (Continue)<br>Note that the data written to this register represents only one pixel, regardless of the source color mode. If the source color mode is 16-bpp (e.g., RGB565), the upper 16 bits of the data are ignored. | –             |

#### 5.2.5 Host to Screen Start Color Expansion Register (CMD4\_REG)

| Register | Address    | R/W | Description                                   | Reset Value |
|----------|------------|-----|---|-------------|
| CMD4_REG | 0x4D408110 | W   | Host to Screen Start Color Expansion Register | 0x0         |

| Field | Bit    | Description                  | Initial State |
|-------|--------|------------------------------|---------------|
| Data  | [31:0] | Color Expansion Data (Start) | –             |

#### 5.2.6 Host to Screen Continue Color Expansion Register (CMD5\_REG)

| Register | Address    | R/W | Description                                      | Reset Value |
|----------|------------|-----|--|-------------|
| CMD5_REG | 0x4D408114 | W   | Host to Screen Continue Color Expansion Register | 0x0         |

| Field | Bit    | Description                     | Initial State |
|-------|--------|---------------------------------|---------------|
| Data  | [31:0] | Color Expansion Data (Continue) | –             |

#### 5.2.7 Memory to Screen Color Expansion Register (CMD7\_REG)

| Register | Address    | R/W | Description                               | Reset Value |
|----------|------------|-----|---|-------------|
| CMD7_REG | 0x4D40811C | W   | Memory to Screen Color Expansion Register | 0x0         |

| Field          | Bit    | Description   | Initial State |
|----------------|--------|---|---------------|
| Memory Address | [31:0] | Bitmap data base address (used in memory-to-screen mode, should be word-aligned). | –             |

## 5.3 PARAMETER SETTING REGISTERS

Resolution

## 5.3.1 Source Image Resolution Register (SRC\_RES\_REG)

| Register    | Address    | R/W | Description                      | Reset Value |
|-------------|------------|-----|----------------------------------|-------------|
| SRC_RES_REG | 0x4D408200 | R/W | Source Image Resolution Register | 0x0         |

| Field    | Bit     | Description  | Initial State |
|----------|---------|--|---------------|
| Reserved | [31:27] |  | 0x0           |
| VertRes  | [26:16] | Vertical resolution of source image.<br>Range: 1 ~ 2040  | 0x0           |
| Reserved | [15:11] |  | 0x0           |
| HoriRes  | [10:0]  | Horizontal resolution of source image.<br>Range: 1 ~ 2040.<br>Note that in YUV mode, HoriRes must be an even number. | 0x0           |

## 5.3.2 Source Image Horizontal Resolution Register (SRC\_HORI\_RES\_REG)

| Register         | Address    | R/W | Description                                 | Reset Value |
|------------------|------------|-----|---|-------------|
| SRC_HORI_RES_REG | 0x4D408204 | R/W | Source Image Horizontal Resolution Register | 0x0         |

| Field    | Bit    | Description  | Initial State |
|----------|--------|--|---------------|
| Reserved | [31:1] | –  | 0x0           |
| HoriRes  | [10:0] | Horizontal resolution of source image.<br>Range: 1 ~ 2040.<br>Note that in YUV mode, HoriRes must be an even number. | 0x0           |

## 5.3.3 Source Image Horizontal Resolution Register (SRC\_HORI\_RES\_REG)

| Register         | Address    | R/W | Description                                 | Reset Value |
|------------------|------------|-----|---|-------------|
| SRC_HORI_RES_REG | 0x4D408204 | R/W | Source Image Horizontal Resolution Register | 0x0         |

| Field    | Bit    | Description   | Initial State |
|----------|--------|---|---------------|
| Reserved | [31:1] | –   | 0x0           |
| VertRes  | [10:0] | Vertical resolution of source image.<br>Range: 1 ~ 2040 | 0x0           |

### 5.3.4 Screen Resolution Register (SC\_RES\_REG)

| Register   | Address    | R/W | Description                | Reset Value |
|------------|------------|-----|----------------------------|-------------|
| SC_RES_REG | 0x4D408210 | R/W | Screen Resolution Register | 0x0         |

| Field    | Bit     | Description   | Initial State |
|----------|---------|---|---------------|
| Reserved | [31:27] | –   | 0x0           |
| VertRes  | [26:16] | Vertical resolution of the screen.<br>Range: 1 ~ 2040   | 0x0           |
| Reserved | [15:11] | –   | 0x0           |
| HoriRes  | [10:0]  | Horizontal resolution of the screen.<br>Range: 1 ~ 2040 | 0x0           |

### 5.3.5 Screen Horizontal Resolution Register (SC\_HORI\_RES\_REG)

| Register        | Address    | R/W | Description                           | Reset Value |
|-----------------|------------|-----|---------------------------------------|-------------|
| SC_HORI_RES_REG | 0x4D408214 | R/W | Screen Horizontal Resolution Register | 0x0         |

| Field    | Bit     | Description   | Initial State |
|----------|---------|---|---------------|
| Reserved | [31:11] | –   | 0x0           |
| HoriRes  | [10:0]  | Horizontal resolution of the screen.<br>Range: 1 ~ 2040 | 0x0           |

### 5.3.6 Screen Vertical Resolution Register (SC\_VERI\_RES\_REG)

| Register        | Address    | R/W | Description                         | Reset Value |
|-----------------|------------|-----|-------------------------------------|-------------|
| SC_VERI_RES_REG | 0x4D408218 | R/W | Screen Vertical Resolution Register | 0x0         |

| Field    | Bit    | Description   | Initial State |
|----------|--------|---|---------------|
| Reserved | [31:1] | –   | 0x0           |
| VeriRes  | [10:0] | Vertical resolution of the screen.<br>Range: 1 ~ 2040 | 0x0           |

## Clipping Window

### 5.3.7 LeftTop Clipping Window Register (CW\_LT\_REG)

| Register  | Address    | R/W | Description                      | Reset Value |
|-----------|------------|-----|----------------------------------|-------------|
| CW_LT_REG | 0x4D408220 | R/W | LeftTop Clipping Window Register | 0x0         |

| Field    | Bit     | Description  | Initial State |
|----------|---------|--|---------------|
| Reserved | [31:27] | –  | 0x0           |
| TopCW_Y  | [26:16] | Top Y Clipping Window<br>Requirement: TopCW_Y < BottomCW_Y                 | 0x0           |
| Reserved | [15:11] | –  | 0x0           |
| LeftCW_X | [10:0]  | Left X Coordinate of Clipping Window.<br>Requirement: LeftCW_X < RightCW_X | 0x0           |

### 5.3.8 Left X Clipping Window Register (CW\_LT\_X\_REG)

| Register    | Address    | R/W | Description                     | Reset Value |
|-------------|------------|-----|---------------------------------|-------------|
| CW_LT_X_REG | 0x4D408224 | R/W | Left X Clipping Window Register | 0x0         |

| Field    | Bit     | Description   | Initial State |
|----------|---------|---|---------------|
| Reserved | [31:11] | –   | 0x0           |
| LeftCW_X | [10:0]  | Left X Clipping Window<br>Requirement: LeftCW_X < RightCW_X | 0x0           |

### 5.3.9 Top Y Clipping Window Register (CW\_LT\_Y\_REG)

| Register    | Address    | R/W | Description                    | Reset Value |
|-------------|------------|-----|--------------------------------|-------------|
| CW_LT_Y_REG | 0x4D408228 | R/W | Top Y Clipping Window Register | 0x0         |

| Field    | Bit     | Description  | Initial State |
|----------|---------|--|---------------|
| Reserved | [31:11] | –  | 0x0           |
| TopCW_Y  | [10:0]  | Top Y Clipping Window<br>Requirement: TopCW_Y < BottomCW_Y | 0x0           |

### 5.3.10 RightBottom Clipping Window Register (CW\_RB\_REG)

| Register  | Address    | R/W | Description                          | Reset Value |
|-----------|------------|-----|--------------------------------------|-------------|
| CW_RB_REG | 0x4D408230 | R/W | RightBottom Clipping Window Register | 0x0         |

| Field      | Bit     | Description   | Initial State |
|------------|---------|---|---------------|
| Reserved   | [31:27] | –   | 0x0           |
| BottomCW_Y | [26:16] | Bottom Y Clipping Window<br>Requirement: BottomCW_Y < VeriRes (SC_VERI_RES_REG) | 0x0           |
| Reserved   | [15:11] | –   | 0x0           |
| RightCW_X  | [10:0]  | Right X Clipping Window<br>Requirement: RightCW_X < HoriRes (SC_HORI_RES_REG)   | 0x0           |

### 5.3.11 Right X Clipping Window Register (CW\_RB\_X\_REG)

| Register    | Address    | R/W | Description                      | Reset Value |
|-------------|------------|-----|----------------------------------|-------------|
| CW_RB_X_REG | 0x4D408234 | R/W | Right X Clipping Window Register | 0x0         |

| Field     | Bit     | Description   | Initial State |
|-----------|---------|---|---------------|
| Reserved  | [31:11] | –   | 0x0           |
| RightCW_X | [10:0]  | Right X Clipping Window<br>Requirement: RightCW_X < HoriRes (SC_HORI_RES_REG) | 0x0           |

### 5.3.12 Bottom Y Clipping Window Register (CW\_RB\_Y\_REG)

| Register    | Address    | R/W | Description                       | Reset Value |
|-------------|------------|-----|-----------------------------------|-------------|
| CW_RB_Y_REG | 0x4D408238 | R/W | Bottom Y Clipping Window Register | 0x0         |

| Field      | Bit     | Description   | Initial State |
|------------|---------|---|---------------|
| Reserved   | [31:11] | –   | 0x0           |
| BottomCW_Y | [10:0]  | Bottom Y Clipping Window<br>Requirement: BottomCW_Y < VeriRes (SC_VERI_RES_REG) | 0x0           |

## Coordinates

### 5.3.13 COORDINATE\_0 Register (COORD0\_REG)

| Register   | Address    | R/W | Description           | Reset Value |
|------------|------------|-----|-----------------------|-------------|
| COORD0_REG | 0x4D408300 | R/W | Coordinate_0 Register | 0x0         |

| Field    | Bit     | Description                       | Initial State |
|----------|---------|-----------------------------------|---------------|
| Reserved | [31:27] | –                                 | 0x0           |
| Y        | [26:16] | Coordinate_0 Y<br>Range: 0 ~ 2039 | 0x0           |
| Reserved | [15:11] | –                                 | 0x0           |
| X        | [10:0]  | Coordinate_0 X<br>Range: 0 ~ 2039 | 0x0           |

### 5.3.14 COORDINATE\_0 X Register (COORD0\_X\_REG)

| Register     | Address    | R/W | Description             | Reset Value |
|--------------|------------|-----|-------------------------|-------------|
| COORD0_X_REG | 0x4D408304 | R/W | Coordinate_0 X Register | 0x0         |

| Field    | Bit     | Description                       | Initial State |
|----------|---------|-----------------------------------|---------------|
| Reserved | [31:11] | –                                 | 0x0           |
| COORD0_X | [10:0]  | Coordinate_0 X<br>Range: 0 ~ 2039 | 0x0           |

### 5.3.15 COORDINATE\_0 Y Register (COORD0\_Y\_REG)

| Register     | Address    | R/W | Description             | Reset Value |
|--------------|------------|-----|-------------------------|-------------|
| COORD0_Y_REG | 0x4D408308 | R/W | Coordinate_0 Y Register | 0x0         |

| Field    | Bit     | Description                       | Initial State |
|----------|---------|-----------------------------------|---------------|
| Reserved | [31:11] | –                                 | 0x0           |

## 5.3.16 COORDINATE\_1 Register (COORD1\_REG)

| Register   | Address    | R/W | Description           | Reset Value |
|------------|------------|-----|-----------------------|-------------|
| COORD1_REG | 0x4D408310 | R/W | Coordinate_1 Register | 0x0         |

| Field    | Bit     | Description                       | Initial State |
|----------|---------|-----------------------------------|---------------|
| Reserved | [31:27] | –                                 | 0x0           |
| Y        | [26:16] | Coordinate_1 Y<br>Range: 0 ~ 2039 | 0x0           |
| Reserved | [15:11] | –                                 | 0x0           |
| X        | [10:0]  | Coordinate_1 X<br>Range: 0 ~ 2039 | 0x0           |

## 5.3.17 COORDINATE\_1 X Register (COORD1\_X\_REG)

| Register     | Address    | R/W | Description             | Reset Value |
|--------------|------------|-----|-------------------------|-------------|
| COORD1_X_REG | 0x4D408314 | R/W | Coordinate_1 X Register | 0x0         |

| Field    | Bit     | Description                       | Initial State |
|----------|---------|-----------------------------------|---------------|
| Reserved | [31:11] | –                                 | 0x0           |
| COORD1_X | [10:0]  | Coordinate_1 X<br>Range: 0 ~ 2039 | 0x0           |

## 5.3.18 COORDINATE\_1 Y Register (COORD1\_Y\_REG)

| Register     | Address    | R/W | Description             | Reset Value |
|--------------|------------|-----|-------------------------|-------------|
| COORD1_Y_REG | 0x4D408318 | R/W | Coordinate_1 Y Register | 0x0         |

| Field    | Bit     | Description                       | Initial State |
|----------|---------|-----------------------------------|---------------|
| Reserved | [31:11] | –                                 | 0x0           |
| COORD1_Y | [10:0]  | Coordinate_1 Y<br>Range: 0 ~ 2039 | 0x0           |

## 5.3.19 COORDINATE\_2 Register (COORD2\_REG)

| Register   | Address    | R/W | Description           | Reset Value |
|------------|------------|-----|-----------------------|-------------|
| COORD2_REG | 0x4D408320 | R/W | Coordinate_2 Register | 0x0         |

| Field    | Bit     | Description                       | Initial State |
|----------|---------|-----------------------------------|---------------|
| Reserved | [31:27] | –                                 | 0x0           |
| Y        | [26:16] | Coordinate_2 Y<br>Range: 0 ~ 2039 | 0x0           |
| Reserved | [15:11] | –                                 | 0x0           |
| X        | [10:0]  | Coordinate_2 X<br>Range: 0 ~ 2039 | 0x0           |

## 5.3.20 COORDINATE\_2 X Register (COORD2\_X\_REG)

| Register     | Address    | R/W | Description             | Reset Value |
|--------------|------------|-----|-------------------------|-------------|
| COORD2_X_REG | 0x4D408324 | R/W | Coordinate_2 X Register | 0x0         |

| Field    | Bit     | Description                       | Initial State |
|----------|---------|-----------------------------------|---------------|
| Reserved | [31:11] | –                                 | 0x0           |
| COORD2_X | [10:0]  | Coordinate_2 X<br>Range: 0 ~ 2039 | 0x0           |

## 5.3.21 COORDINATE\_2 Y Register (COORD2\_Y\_REG)

| Register     | Address    | R/W | Description             | Reset Value |
|--------------|------------|-----|-------------------------|-------------|
| COORD2_Y_REG | 0x4D408328 | R/W | Coordinate_2 Y Register | 0x0         |

| Field    | Bit     | Description                       | Initial State |
|----------|---------|-----------------------------------|---------------|
| Reserved | [31:11] | –                                 | 0x0           |
| COORD2_Y | [10:0]  | Coordinate_2 Y<br>Range: 0 ~ 2039 | 0x0           |

## 5.3.22 COORDINATE\_3 REGISTER (COORD3\_REG)

| Register   | Address    | R/W | Description           | Reset Value |
|------------|------------|-----|-----------------------|-------------|
| COORD3_REG | 0x4D408330 | R/W | Coordinate_3 Register | 0x0         |

| Field    | Bit     | Description                       | Initial State |
|----------|---------|-----------------------------------|---------------|
| Reserved | [31:27] | –                                 | 0x0           |
| Y        | [26:16] | Coordinate_3 Y<br>Range: 0 ~ 2039 | 0x0           |
| Reserved | [15:11] | –                                 | 0x0           |
| X        | [10:0]  | Coordinate_3 X<br>Range: 0 ~ 2039 | 0x0           |

## 5.3.23 COORDINATE\_3 X Register (COORD3\_X\_REG)

| Register     | Address    | R/W | Description             | Reset Value |
|--------------|------------|-----|-------------------------|-------------|
| COORD3_X_REG | 0x4D408334 | R/W | Coordinate_3 X Register | 0x0         |

| Field    | Bit     | Description                       | Initial State |
|----------|---------|-----------------------------------|---------------|
| Reserved | [31:11] | –                                 | 0x0           |
| COORD3_X | [10:0]  | Coordinate_3 X<br>Range: 0 ~ 2039 | 0x0           |

## 5.3.24 COORDINATE\_3 Y Register (COORD3\_Y\_REG)

| Register     | Address    | R/W | Description             | Reset Value |
|--------------|------------|-----|-------------------------|-------------|
| COORD3_Y_REG | 0x4D408338 | R/W | Coordinate_3 Y Register | 0x0         |

| Field    | Bit     | Description                       | Initial State |
|----------|---------|-----------------------------------|---------------|
| Reserved | [31:11] | –                                 | 0x0           |
| COORD3_Y | [10:0]  | Coordinate_3 Y<br>Range: 0 ~ 2039 | 0x0           |

## Rotation

### 5.3.25 Rotation Origin Coordinate Register (ROT\_OC\_REG)

| Register   | Address    | R/W | Description                         | Reset Value |
|------------|------------|-----|-------------------------------------|-------------|
| ROT_OC_REG | 0x4D408340 | R/W | Rotation Origin Coordinate Register | 0x0         |

| Field    | Bit     | Description  | Initial State |
|----------|---------|--|---------------|
| Reserved | [31:27] | –  | 0x0           |
| Y        | [26:16] | X coordinate of the reference point of rotation<br>Range: 0 ~ 2039 | 0x0           |
| Reserved | [15:11] | –  | 0x0           |
| X        | [10:0]  | Y coordinate of the reference point of rotation<br>Range 0 ~ 2039  | 0x0           |

### 5.3.26 Rotation Origin Coordinate X Register (ROT\_OC\_X\_REG)

| Register | Address    | R/W | Description                           | Reset Value |
|----------|------------|-----|---------------------------------------|-------------|
| ROT_OC_X | 0x4D408344 | R/W | Rotation Origin Coordinate X Register | 0x0         |

| Field    | Bit     | Description  | Initial State |
|----------|---------|--|---------------|
| Reserved | [31:11] | –  | 0x0           |
| ROT_OC_X | [10:0]  | X coordinate of the reference point of rotation<br>Range: 0 ~ 2039 | 0x0           |

### 5.3.27 Rotation Origin Coordinate Y Register (ROT\_OC\_Y\_REG)

| Register | Address    | R/W | Description                           | Reset Value |
|----------|------------|-----|---------------------------------------|-------------|
| ROT_OC_Y | 0x4D408348 | R/W | Rotation Origin Coordinate Y Register | 0x0         |

| Field    | Bit    | Description   | Initial State |
|----------|--------|---|---------------|
| Reserved | [31:1] | –   | 0x0           |
| ROT_OC_Y | [10:0] | Y coordinate of the reference point of rotation<br>Range 0 ~ 2039 | 0x0           |

## 5.3.28 Rotation Register (ROTATE\_REG)

| Register   | Address    | R/W | Description       | Reset Value |
|------------|------------|-----|-------------------|-------------|
| ROTATE_REG | 0x4D40834C | R/W | Rotation Register | 0x0         |

| Field    | Bit    | Description   | Initial State |
|----------|--------|---------------|---------------|
| Reserved | [31:6] |               | 0x0           |
| FY       | [5]    | Y-flip        | 0x0           |
| FX       | [4]    | X-flip        | 0x0           |
| R3       | [3]    | 270° Rotation | 0x0           |
| R2       | [2]    | 180° Rotation | 0x0           |
| R1       | [1]    | 90° Rotation  | 0x0           |
| R0       | [0]    | 0° Rotation   | 0x1           |

\* If the two or more of Rn are set to 1 at the same time, drawing engine operates unpredictably.

## X,Y Increment Setting

### 5.3.29 X Increment Register (X\_INCR\_REG)

| Register   | Address    | R/W | Description          | Reset Value |
|------------|------------|-----|----------------------|-------------|
| X_INCR_REG | 0x4D408400 | R/W | X Increment Register | 0x0         |

| Field    | Bit     | Description   | Initial State |
|----------|---------|---|---------------|
| Reserved | [31:22] | –   | 0x0           |
| X_INCR   | [21:0]  | X increment value (2's complement, 11-digit fraction) | 0x0           |

### 5.3.30 Y Increment Register (Y\_INCR\_REG)

| Register   | Address    | R/W | Description          | Reset Value |
|------------|------------|-----|----------------------|-------------|
| Y_INCR_REG | 0x4D408404 | R/W | Y Increment Register | 0x0         |

| Field    | Bit     | Description   | Initial State |
|----------|---------|---|---------------|
| Reserved | [31:22] | –   | 0x0           |
| Y_INCR   | [21:0]  | Y increment value (2's complement, 11-digit fraction) | 0x0           |

## ROP & Alpha Setting

### 5.3.31 Raster Operation Register (ROP\_REG)

| Register | Address    | R/W | Description               | Reset Value |
|----------|------------|-----|---------------------------|-------------|
| ROP_REG  | 0x4D408410 | R/W | Raster Operation Register | 0x0         |

| Field     | Bit     | Description  | Initial State |
|-----------|---------|--|---------------|
| Reserved  | [31:14] | –  | 0x0           |
| OS        | [13]    | Third Operand Select :<br>1'b0 = Pattern<br>1'b1 = Foreground Color  | 0x0           |
| ABM       | [12:10] | Alpha Mode :<br>3'b000 = No Alpha Blending<br>3'b001 = Perpixel Alpha Blending with Source Bitmap<br>3'b010 = Alpha Blending with Alpha Register<br>3'b100 = Fading<br>Others = Reserved<br>Note that Perpixel Alpha Blending can only be applied on bit block transfer. | 0x0           |
| T         | [9]     | 0 = Opaque Mode<br>1 = Transparent Mode  | 0x0           |
| Reserved  | [8]     | Reserved   | 0x0           |
| ROP Value | [7:0]   | Raster Operation Value   | 0x0           |

### 5.3.32 Alpha Register (ALPHA\_REG)

| Register  | Address    | R/W | Description    | Reset Value |
|-----------|------------|-----|----------------|-------------|
| ALPHA_REG | 0x4D408420 | R/W | Alpha Register | 0x0         |

| Field    | Bit     | Description         | Initial State |
|----------|---------|---------------------|---------------|
| Reserved | [31:16] | –                   | 0x0           |
| Fading   | [15:8]  | Fading Offset Value | 0x0           |
| Alpha    | [7:0]   | Alpha Value         | 0x0           |

## Color

### 5.3.33 Foreground Color Register (FG\_COLOR\_REG)

| Register     | Address    | R/W | Description               | Reset Value |
|--------------|------------|-----|---------------------------|-------------|
| FG_COLOR_REG | 0x4D408500 | R/W | Foreground Color Register | 0x0         |

| Field           | Bit    | Description   | Initial State |
|-----------------|--------|---|---------------|
| ForegroundColor | [31:0] | Foreground Color Value.<br>The alpha field of the foreground color will be discarded. | 0x0           |

### 5.3.34 Background Color Register (BG\_COLOR\_REG)

| Register     | Address    | R/W | Description               | Reset Value |
|--------------|------------|-----|---------------------------|-------------|
| BG_COLOR_REG | 0x4D408504 | R/W | Background Color Register | 0x0         |

| Field           | Bit    | Description   | Initial State |
|-----------------|--------|---|---------------|
| BackgroundColor | [31:0] | Background Color Value.<br>The alpha field of the background color will be discarded. | 0x0           |

### 5.3.35 BlueScreen Color Register (BS\_COLOR\_REG)

| Register     | Address    | R/W | Description               | Reset Value |
|--------------|------------|-----|---------------------------|-------------|
| BS_COLOR_REG | 0x4D408508 | R/W | BlueScreen Color Register | 0x0         |

| Field           | Bit    | Description  | Initial State |
|-----------------|--------|--|---------------|
| BlueScreenColor | [31:0] | BlueScreen Color Value.<br>The alpha field of the blue screen color will be discarded. | 0x0           |

### 5.3.36 Source Image Color Mode Register (SRC\_COLOR\_MODE\_REG)

| Register           | Address    | R/W | Description                      | Reset Value |
|--------------------|------------|-----|----------------------------------|-------------|
| SRC_COLOR_MODE_REG | 0x4D408510 | R/W | Source Image Color Mode Register | 0x0         |

| Field         | Bit    | Description  | Initial State |
|---------------|--------|--|---------------|
| Reserved      | [31:4] | –  | 0x0           |
| YUV           | [3]    | 0 = RGB mode<br>This bit should be set to 0 in point/line drawing mode and color expansion mode.   | 0x0           |
| Color Setting | [2:0]  | 3'b000 = RGB_565<br>3'b001 = RGBA_5551<br>3'b010 = ARGB_1555<br>3'b011 = RGBA_8888<br>3'b100 = ARGB_8888<br>3'b101 = XRGB_8888<br>3'b110 = RGBX_8888<br>The Color Setting is ignored if YUV mode is selected | 0x0           |

### 5.3.37 Destination Image Color Mode Register (DEST\_COLOR\_MODE\_REG)

| Register            | Address    | R/W | Description                           | Reset Value |
|---------------------|------------|-----|---------------------------------------|-------------|
| DEST_COLOR_MODE_REG | 0x4D408514 | R/W | Destination Image Color Mode Register | 0x0         |

| Field         | Bit    | Description  | Initial State |
|---------------|--------|--|---------------|
| Reserved      | [31:4] | –  | 0x0           |
| Color Setting | [2:0]  | 3'b000 = RGB_565<br>3'b001 = RGBA_5551<br>3'b010 = ARGB_1555<br>3'b011 = RGBA_8888<br>3'b100 = ARGB_8888<br>3'b101 = XRGB_8888<br>3'b110 = RGBX_8888 | 0x0           |

## Pattern

### 5.3.38 Pattern Register (PAT\_REG)

| Register | Address          | R/W | Description      | Reset Value |
|----------|------------------|-----|------------------|-------------|
| PAT_REG  | 0x4D408600 ~ 67C | R/W | Pattern Register | 0x0         |

| Field   | Bit    | Description      | Initial State |
|---------|--------|------------------|---------------|
| PAT_REG | [31:0] | Pattern Register | 0x0           |

### 5.3.39 Pattern Offset Register (PATOFF\_REG)

| Register   | Address    | R/W | Description             | Reset Value |
|------------|------------|-----|-------------------------|-------------|
| PATOFF_REG | 0x4D408700 | R/W | Pattern Offset Register | 0x0         |

| Field    | Bit     | Description           | Initial State |
|----------|---------|-----------------------|---------------|
| Reserved | [31:19] | –                     | 0x0           |
| POffsetY | [18:16] | Pattern OffsetY Value | 0x0           |
| Reserved | [15:3]  | –                     | 0x0           |
| POffsetX | [2:0]   | Pattern OffsetX Value | 0x0           |

### 5.3.40 Pattern Offset X Register (PATOFF\_X\_REG)

| Register     | Address    | R/W | Description               | Reset Value |
|--------------|------------|-----|---------------------------|-------------|
| PATOFF_X_REG | 0x4D408704 | R/W | Pattern Offset X Register | 0x0         |

| Field    | Bit    | Description           | Initial State |
|----------|--------|-----------------------|---------------|
| Reserved | [31:3] | –                     | 0x0           |
| POffsetX | [2:0]  | Pattern OffsetX Value | 0x0           |

### 5.3.41 Pattern Offset Y Register (PATOFF\_Y\_REG)

| Register     | Address    | R/W | Description               | Reset Value |
|--------------|------------|-----|---------------------------|-------------|
| PATOFF_Y_REG | 0x4D408708 | R/W | Pattern Offset Y Register | 0x0         |

| Field    | Bit    | Description           | Initial State |
|----------|--------|-----------------------|---------------|
| Reserved | [31:3] | –                     | 0x0           |
| POffsetY | [2:0]  | Pattern OffsetY Value | 0x0           |

## Stencil Test

### 5.3.42 Colorkey Control Register (COLORKEY\_CTRL\_REG)

| Register          | Address    | R/W | Description               | Reset Value |
|-------------------|------------|-----|---------------------------|-------------|
| COLORKEY_CTRL_REG | 0x4D408720 | R/W | Colorkey Control Register | 0x0         |

| Field          | Bit    | Description   | Initial State |
|----------------|--------|---|---------------|
| Reserved       | [31:5] | –   | 0x0           |

### 5.3.43 Colorkey Decision Reference Minimum Register (COLORKEY\_DR\_MIN\_REG)

| Register            | Address    | R/W | Description                                  | Reset Value |
|---------------------|------------|-----|--|-------------|
| COLORKEY_DR_MIN_REG | 0x4D408724 | R/W | Colorkey Decision Reference Minimum Register | 0x0         |

| Field     | Bit     | Description        | Initial State |
|-----------|---------|--------------------|---------------|
| A_DR(min) | [31:24] | Alpha DR MIN value | 0x0           |
| R_DR(min) | [23:16] | RED DR MIN value   | 0x0           |
| G_DR(min) | [15:8]  | GREEN DR MIN value | 0x0           |
| B_DR(min) | [7:0]   | BLUE DR MIN value  | 0x0           |

## 5.3.44 COLORKEY DECISION REFERENCE MAXIMUM REGISTER (COLORKEY\_DR\_MAX\_REG)

| Register            | Address    | R/W | Description                                  | Reset Value |
|---------------------|------------|-----|--|-------------|
| COLORKEY_DR_MAX_REG | 0x4D408728 | R/W | Colorkey Decision Reference Maximum Register | 0xFFFF_FFFF |

| Field     | Bit     | Description        | Initial State |
|-----------|---------|--------------------|---------------|
| A_DR(max) | [31:24] | Alpha DR MAX value | 0xF           |
| R_DR(max) | [23:16] | RED DR MAX value   | 0xF           |
| G_DR(max) | [15:8]  | GREEN DR MAX value | 0xF           |
| B_DR(max) | [7:0]   | BLUE DR MAX value  | 0xF           |

### Image Base Address

## 5.3.45 Source Image Base Address Register (SRC\_BASE\_ADDR\_REG)

| Register          | Address    | R/W | Description                        | Reset Value |
|-------------------|------------|-----|------------------------------------|-------------|
| SRC_BASE_ADDR_REG | 0x4D408730 | R/W | Source Image Base Address Register | 0x0         |

| Field | Bit    | Description                      | Initial State |
|-------|--------|----------------------------------|---------------|
| ADDR  | [31:0] | Base address of the source image | 0x0           |

## 5.3.46 Destination Image Base Address Register (DEST\_BASE\_ADDR\_REG)

| Register           | Address    | R/W | Description                             | Reset Value |
|--------------------|------------|-----|---|-------------|
| DEST_BASE_ADDR_REG | 0x4D408734 | R/W | Destination Image Base Address Register | 0x0         |

| Field | Bit    | Description  | Initial State |
|-------|--------|--|---------------|
| ADDR  | [31:0] | Base address of the destination image (in most cases, it is also the frame buffer base address). | 0x0           |

**NOTES**

# 20

## HS\_SPI CONTROLLER

### 1 OVERVIEW

The High Speed Serial Peripheral Interface (HS\_SPI) can interface the serial data transfer. HS\_SPI has two 8/16/32-bit shift registers for transmission and receiving, respectively. During an HS\_SPI transfer, data is simultaneously transmitted (shifted out serially) and received (shifted in serially). HS\_SPI supports the protocols for National Semiconductor Microwire and Motorola Serial Peripheral Interface.

### 2 FEATURES

The features of the HS\_SPI are:

- Supports full duplex
- 8/16/32-bit shift register for TX/RX
- 8-bit prescale logic
- 3 clock source
- Supports 8bit/16bit/32bit bus interface
- Supports the Motorola HS\_SPI protocol and National Semiconductor Microwire
- Two independent transmit and receive FIFOs, each 16 samples deep by 32-bits wide
- Master-mode and Slave-mode
- Receive-without-transmit operation

### 3 SIGNAL DESCRIPTIONS

The following table lists the external signals between the HS\_SPI and external device. All ports of the HS\_SPI can be used as General Purpose I/O ports when disable. See "General Purpose I/O" chapter for detailed pin configuration.

**Table 20-1. External Signals Description**

| Channel   | Name      | Direction | Description  |
|-----------|-----------|-----------|--|
| Channel 0 | PSPICLK0  | Inout     | PSPICLK0 is the serial clock used to control time to transfer data.  |
|           | PSPIMISO0 | Inout     | In Master mode, this port is to be input port to get data from slave output port. Data are transmitted to master through this port when in slave mode.       |
|           | PSPIMOSI0 | Inout     | In Master mode, this port is to be output port to transfer data from master output port. Data are received from master through this port when in slave mode. |
|           | PSS0      | Inout     | As to be slave selection signal, all data TX/RX sequences are executed when PSS0 is low.   |
| Channel 1 | PSPICLK1  | Inout     | PSPICLK1 is the serial clock used to control time to transfer data.  |
|           | PSPIMISO1 | Inout     | In Master mode, this port is to be input port to get data from slave output port. Data are transmitted to master through this port when in slave mode.       |
|           | PSPIMOSI1 | Inout     | In Master mode, this port is to be output port to transfer data from master output port. Data are received from master through this port when in slave mode. |
|           | PSS1      | Inout     | As to be slave selection signal, all data TX/RX sequences are executed when PSS1 is low.   |

### 4 OPERATION

The HS\_SPI in S3C2451 transfers 1-bit serial data between S3C2451 and external device. The HS\_SPI in S3C2451 supports that CPU or DMA can access to transmit or receive FIFOs separately and to transfer data in both direction simultaneously. HS\_SPI has 2 channel, TX channel and RX channel. TX channel has a path only from Tx FIFO to external device. RX channel has a path only from external device to RX FIFO.

CPU(or DMA) should write data on the register HS\_SPI\_TX\_DATA to write data in FIFO. Data on the register are automatically moved to Tx FIFOs. To read data from Rx FIFOs, CPU(or DMA) should access the register HS\_SPI\_RX\_DATA and then data are automatically sent to the register HS\_SPI\_RX\_DATA.

#### 4.1 OPERATION MODE

HS\_SPI has 2 modes, master and slave mode. In master mode, SPICLK is generated and transmitted to external device. PSS, which is signal to select slave, indicates data valid when it is low level. PSS should be set low before packets starts to be transmitted or received.

#### 4.2 FIFO ACCESS

The HS\_SPI in S3C2451 supports CPU access and DMA access to FIFOs. Data size of CPU access and DMA access to FIFOs can be selected 8-bit/16-bit/32-bit data. If 8-bit data size is chosen, valid bits are from 0 bit to 7 bit. CPU accesses are normally on and off by trigger threshold user defines. The trigger level of each FIFOs is set from 0byte to 64bytes. TxDMAOn or RxDMAOn bit of HS\_SPI\_MODE\_CFG register should be set to use DMA access. DMA access supports only single transfer and 4-burst transfer. In TX FIFO, DMA request signal is high until that FIFO is full. In RX FIFO, dma request signal is high if FIFO is not empty.

#### 4.3 TRAILING BYTES IN THE RX FIFO

When the number of samples in Rx FIFO is less than the threshold value in INT mode or DMA 4 burst mode and no additional data is received, the remaining bytes are called trailing bytes. To remove these bytes in RX FIFO, internal timer and interrupt signal are used. The value of internal timer can be set up to 1024 clocks based on APB BUS clock. When timer value is to be zero, interrupt signal is occurred and CPU can remove trailing bytes in FIFO.

#### 4.4 PACKET NUMBER CONTROL

HS\_SPI can control the number of packets to be received in master mode. If there is any number of packets to be received, just set the SFR(Packet\_Count\_reg) how many packets have to be received. HS\_SPI stops generating HS\_SPICLK when the number of packets is the same as what you set. But, software reset or hardware reset should be followed before that this function is reload.

#### 4.5 NCS CONTROL

nCS can be selected auto control or manual control. In manual control, Auto\_n\_Manual should be set default value 0. nCS level is decided as the same as that nSSout bit is set. nCS can be toggled between packet and packet in auto control. Auto\_n\_Manual is set to 1 and nCS\_time\_count should be set as long as nCS is inactive. nSSout is not available at this time.

4.6 HS\_SPI TRANSFER FORMAT

The S3C2451 supports 4 different format to transfer the data. Figure 20-1 shows four waveforms for HS\_SPICLK.

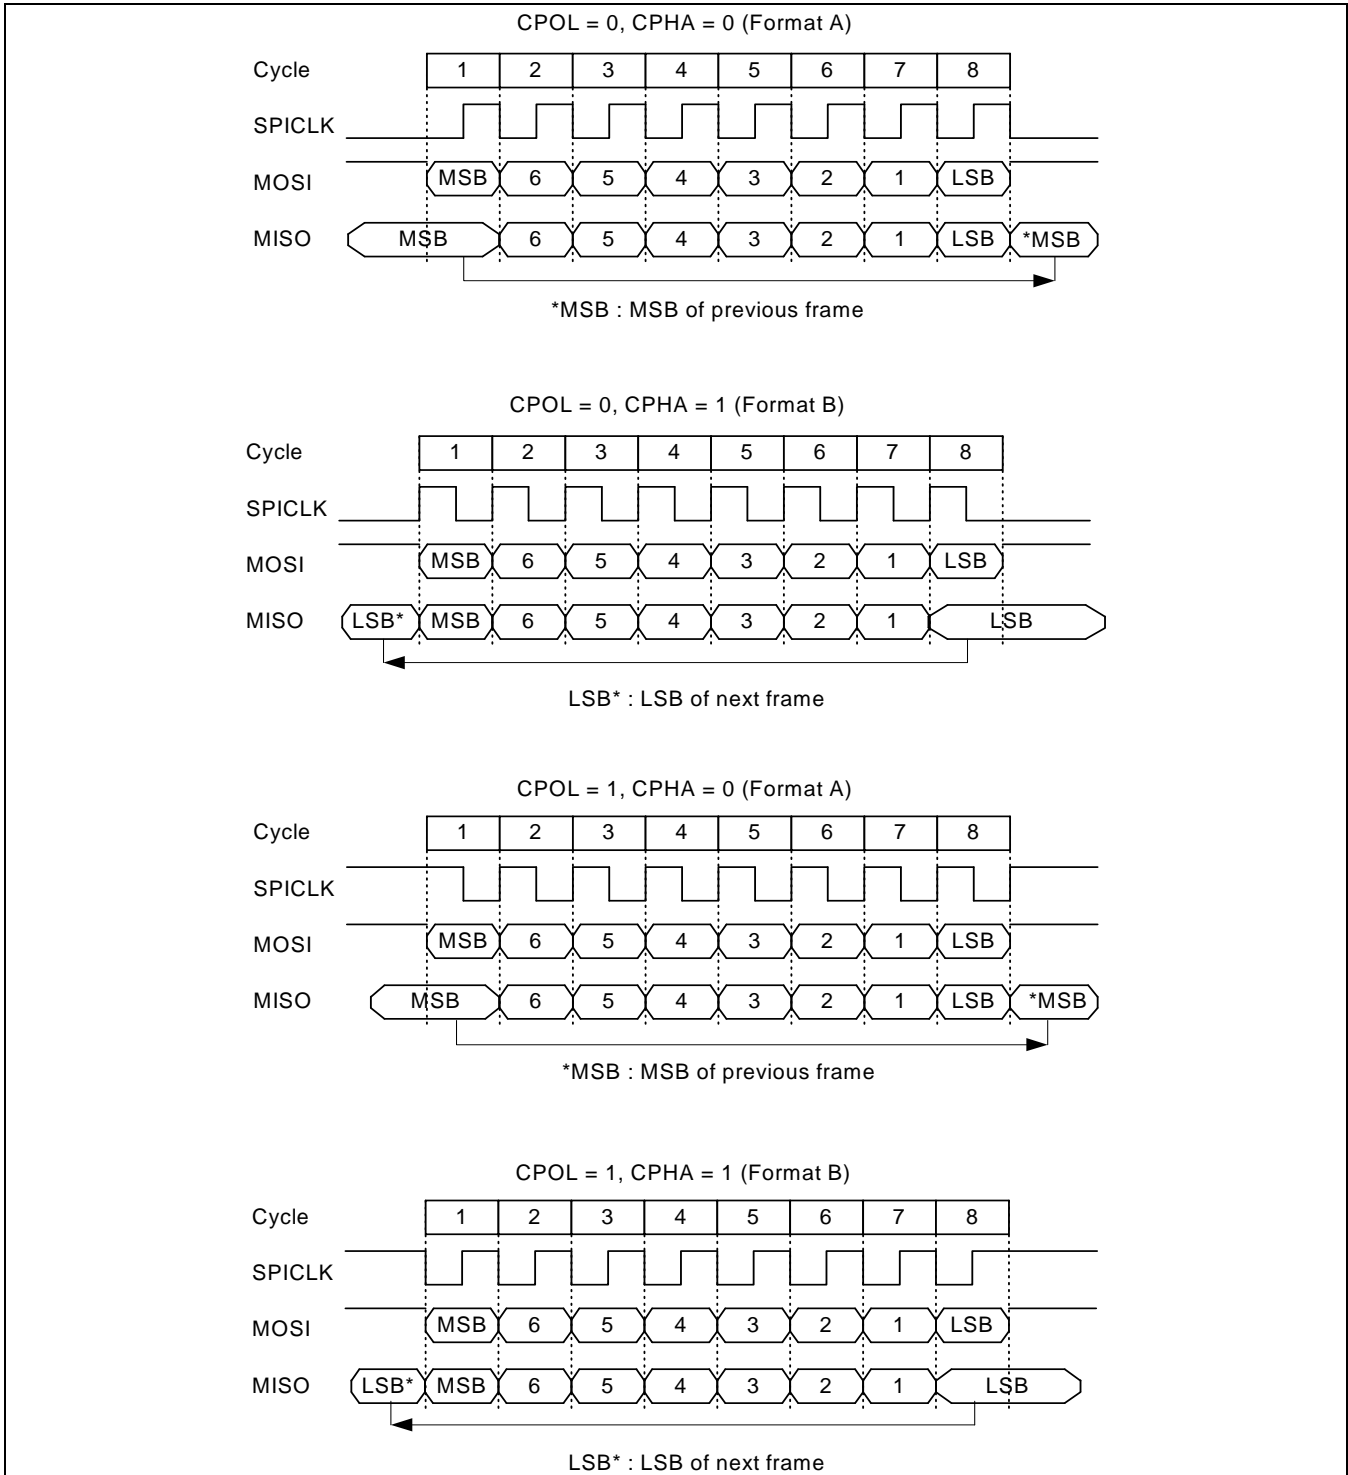

Figure 20-1. HS\_SPI Transfer Format

## 5 EXTERNAL LOADING CAPACITANCE

HS\_SPI with an output capacitance higher than 10pF is not guaranteed.  
OUTPUT CAPACITANCE must be lower than 10pF at both channels.

## 6 SPECIAL FUNCTION REGISTER DESCRIPTIONS

### 6.1 SETTING SEQUENCE OF SPECIAL FUNCTION REGISTER

Special Function Register should be set as the following sequence. (nCS manual mode)

1. Set Transfer Type. (CPOL & CPHA set)
2. Set Clock configuration register.
3. Set HS\_SPI MODE configuration register.
4. Set HS\_SPI INT\_EN register.
5. Set Packet Count configuration register if necessary.
6. Set Tx or Rx Channel on.
7. Set nSSout low to start Tx or Rx operation.
  - A. Set nSSout Bit to low, then start TX data writing.
  - B. If auto chip selection bit is set, should not control nCS.

## 6.2 SPECIAL FUNCTION REGISTER

| Register    | Address    | R/W | Description                   | Reset Value |
|-------------|------------|-----|-------------------------------|-------------|
| CH_CFG(Ch0) | 0x52000000 | R/W | HS_SPI configuration register | 0x0000_0040 |

## NOTES

# 21

## SD/MMC HOST CONTROLLER

This chapter describes the SD/SDIO/MMC/CE-ATA host controller and related registers supported by S3C2451X RISC microprocessor.

### 1 OVERVIEW

The HSMMC (High-speed MMC) SDMMC is a combo host for Secure Digital card and MultiMedia Card. This host is compatible for SD Association's (SDA) Host Standard Specification.

You can interface your system with SD card and MMC card. This performance of this host is very powerful, you would get 50MHz clock rate and access 8-bit data pin simultaneously.

We provide 2 Channel HSMMC support.

CH0 only 4 bit data interface support.

### 2 FEATURES

- SD Standard Host Spec(ver 2.0) compatible
- SD Memory Card Spec(ver 2.0) / High Speed MMC Spec(4.2) compatible
- SDIO Card Spec(Ver 1.0) compatible
- 512 bytes FIFO for data Tx/Rx
- 48-bit Command Register
- 136-bit Response Register
- CPU Interface and DMA data transfer mode
- 1bit / 4bit / 8bit(Channel 1 only) mode switch support.
- Auto CMD12 support
- Suspend / Resume support
- Read Wait operation support
- Card Interrupt support
- CE-ATA mode support

3 BLOCK DIAGRAM

Figure 21-1. HSMMC Block Diagram

## 4 SEQUENCE

This section defines basic sequence flow chart divided into several sub sequences. "Wait for interrupts" is used in the flow chart. This means the Host Driver waits until specified interrupts are asserted. If already asserted, then fall through that step in the flow chart. Timeout checking shall be always required to detect no interrupt generated but this is not described in the flow chart.

### 4.1 SD CARD DETECTION SEQUENCE

**Figure 21-2. SD Card Detect Sequence**

The flow chart for detecting a SD card is shown in Figure 21-2. Each step is executed as follows:

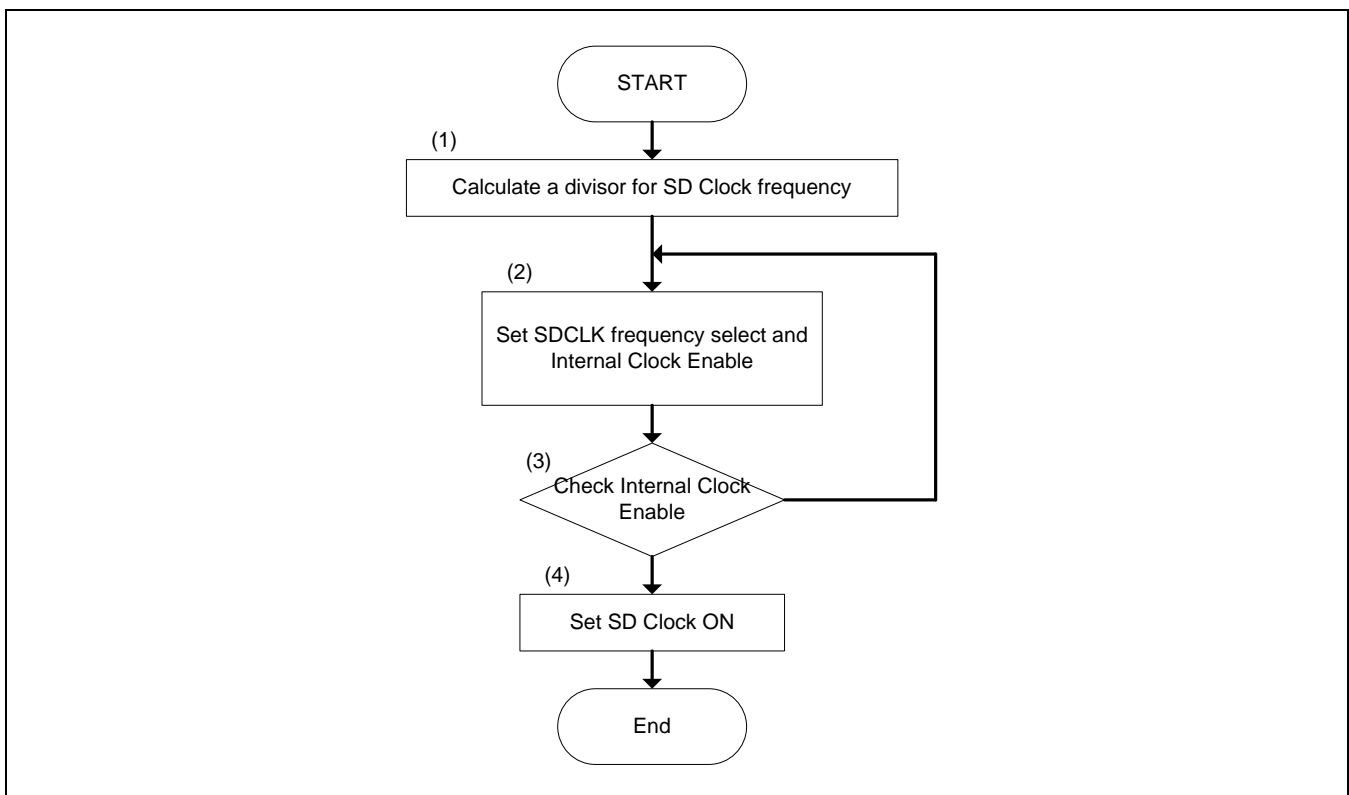

(1) To enable interrupt for card detection, write 1 to the following bits:

Card Insertion Status Enable(ENSTACARDNS) in the Normal Interrupt Status Enable register  
 Card Insertion Signal Enable(ENSIGCARDNS) in the Normal Interrupt Signal Enable register  
 Card Removal Status Enable(ENSTACARDREM) in the Normal Interrupt Status Enable register  
 Card Removal Signal Enable(ENSIGCARDREM) in the Normal Interrupt Signal Enable register

(2) When the Host Driver detects the card insertion or removal, clear its interrupt statuses. If Card Insertion interrupt(STACARDINS) is generated, write 1 to Card Insertion in the Normal Interrupt Status register. If Card Removal interrupt(STACARDREM) is generated, write 1 to Card Removal in the Normal Interrupt Status register.

(3) Check Card Inserted in the Present State register. In the case where Card Inserted(INSCARD) is 1, the Host Driver can supply the power and the clock to the SD card. In the case where Card Inserted is 0, the other executing processes of the Host Driver shall be immediately closed.

## 4.2 SD CLOCK SUPPLY SEQUENCE

**Figure 21-3. SD Clock Supply Sequence**

The sequence for supplying SD Clock to a SD card is described in Figure 21-3. The clock shall be supplied to the card before either of the following actions is taken.

- a) Issuing a SD command
  - b) Detect an interrupt from a SD card in 4-bit mode.
- (1) Calculate a divisor to determine SD Clock frequency by reading Base Clock Frequency for SD Clock in the Capabilities register. If Base Clock Frequency for SD Clock is 00 0000b, the Host System shall provide this information to the Host Driver by another method.
  - (2) Set Internal Clock Enable(ENINTCLK) and SDCLK Frequency Select in the Clock Control register in accordance with the calculated result of step (1).
  - (3) Check Internal Clock Stable(STBLINTCLK) in the Clock Control register. Repeat this step until Clock Stable is 1.
  - (4) Set SD Clock Enable(ENSDCLK) in the Clock Control register to 1. Then, the Host Controller starts to supply the SD Clock.

### 4.3 SD CLOCK STOP SEQUENCE

**Figure 21-4. SD Clock Stop Sequence**

The flow chart for stopping the SD Clock is shown in Figure 21-4. The Host Driver shall not stop the SD Clock when a SD transaction is occurring on the SD Bus -- namely, when either Command Inhibit (DAT) or Command Inhibit (CMD) in the Present State register is set to 1.

- (1) Set SD Clock Enable(ENSDCLK) in the Clock Control register to 0. Then, the Host Controller stops supplying the SD Clock.

### 4.4 SD CLOCK FREQUENCY CHANGE SEQUENCE

**Figure 21-5. SD Clock Change Sequence**

The sequence for changing SD Clock frequency is shown in Figure 21-5. When SD Clock is still off, step (1) is omitted.

## 4.5 SD BUS POWER CONTROL SEQUENCE

Figure 21-6. SD Bus Power Control Sequence

The sequence for controlling the SD Bus Power is described in Figure 21-6.

- (1) By reading the Capabilities register, get the support voltage of the Host Controller.
- (2) Set SD Bus Voltage Select in the Power Control register with maximum voltage that the Host Controller supports.
- (3) Set SD Bus Power(PWRON) in the Power Control register to 1.
- (4) Get the OCR value of all function internal of SD card.
- (5) Judge whether SD Bus voltage needs to be changed or not. In case where SD Bus voltage needs to be changed, go to step (6). In case where SD Bus voltage does not need to be changed, go to 'End'.
- (6) Set SD Bus Power in the Power Control register to 0 for clearing this bit. The card requires voltage rising from 0 volt to detect it correctly. The Host Driver shall clear SD Bus Power before changing voltage by setting SD Bus Voltage Select.
- (7) Set SD Bus Voltage Select(SELPWRLVL) in the Power Control register.
- (8) Set SD Bus Power(PWRON) in the Power Control register to 1.

**NOTE:** Step (2) and step (3) can be executed at same time. And also, step (7) and step (8) can be executed at same time.

## 4.6 CHANGE BUS WIDTH SEQUENCE

Figure 21-7. Change Bus Width Sequence

The sequence for changing bit mode on SD Bus is shown in Figure 21-7.

- (1) Set Card Interrupt Status Enable(STACARDINT) in the Normal Interrupt Status Enable register to 0 for masking incorrect interrupts that may occur while changing the bus width.
- (2) In case of SD memory only card, go to step (4). In case of other card, go to step (3).
- (3) Set "IENM" of the CCCR in a SDIO or SD combo card to 0 by CMD52.
- (4) Change the bit mode for a SD card. Changing SD memory card bus width by ACMD6(Set bus width) and changing SDIO card bus width by setting Bus Width of Bus Interface Control register in CCCR.
- (5) In case of changing to 4-bit mode, set Data Transfer Width(WIDE4) in the Host Control register to 1. In another case (1-bit mode), set this bit to 0.
- (6) In case of SD memory only card, go to the 'End'. In case of other card, go to step (7).
- (7) Set "IENM" of the CCCR in a SDIO or SD combo card to 1 by CMD52.
- (8) Set Card Interrupt Status Enable in the Normal Interrupt Status Enable register to 1.

#### 4.7 TIMEOUT SETTING FOR DAT LINE

**Figure 21-8. Timeout Setting Sequence**

In order to detect timeout errors on DAT line, the Host Driver shall execute the following two steps before any SD transaction.

- (1) Calculate a divisor to detect timeout errors by reading Timeout Clock Frequency and Timeout Clock Unit in the Capabilities register. If Timeout Clock Frequency is 00 0000b, the Host System shall provide this information to the Host Driver by another method.
- (2) Set Data Timeout Counter Value(TIMEOUTCON) in the Timeout Control register in accordance with the value from step (1) above.

#### 4.8 SD TRANSACTION GENERATION

This section describes the sequences how to generate and control various kinds of SD transactions. SD transactions are classified into three cases:

- (1) Transactions that do not use the DAT line.
- (2) Transactions that use the DAT line only for the busy signal.
- (3) Transactions that use the DAT line for transferring data.

In this specification the first and the second case's transactions are classified as "Transaction Control without Data Transfer using DAT Line," the third case's transaction is classified as "Transaction Control with Data Transfer using DAT Line."

Please refer to the specifications below for the detailed specifications on the SD Command itself:

- SD Memory Card Specification Part 1  
PHYSICAL LAYER SPECIFICATION Version 1.01
- SD Card Specification PART E1  
Secure Digital Input/Output (SDIO) Specification Version 1.00

4.9 SD COMMAND ISSUE SEQUENCE

Figure 21-9. Timeout Setting Sequence

- (1) Check Command Inhibit (CMD) in the Present State register. Repeat this step until Command Inhibit (CMD) is 0. That is, when Command Inhibit (CMD) is 1, the Host Driver shall not issue a SD Command.
- (2) If the Host Driver issues a SD Command with busy signal, go to step (3). If without busy signal, go to step (5).
- (3) If the Host Driver issues an abort command, go to step (5). In the case of no abort command, go to step (4).
- (4) Check Command Inhibit (DAT) in the Present State register. Repeat this step until Command Inhibit (DAT) is 0.
- (5) Set the value corresponding to the issued command in the Argument register.
- (6) Set the value corresponding to the issued command in the Command register.

**NOTE:** Writing the upper byte in the Command register causes a SD command to be issued.

- (7) Perform Command Complete Sequence

#### 4.10 COMMAND COMPLETE SEQUENCE

The sequence for completing the SD Command is shown in Figure 21-10. There is a possibility that the errors (Command Index/End bit/CRC/Timeout Error) occur during this sequence.

- (1) Wait for the Command Complete Interrupt. If the Command Complete Interrupt has occurred, go to step (2).
- (2) Write 1 to Command Complete(STACMDCMPLT) in the Normal Interrupt Status register to clear this bit.
- (3) Read the Response register and get necessary information in accordance with the issued command.
- (4) Judge whether the command uses the Transfer Complete Interrupt or not. If it uses Transfer Complete, go to step (5). If not, go to step (7).
- (5) Wait for the Transfer Complete Interrupt. If the Transfer Complete Interrupt has occurred, go to step (6).
- (6) Write 1 to Transfer Complete(STATRANCMPLE) in the Normal Interrupt Status register to clear this bit.
- (7) Check for errors in Response Data. If there is no error, go to step (8). If there is an error, go to step (9).
- (8) Return Status of "No Error".
- (9) Return Status of "Response Contents Error".

#### NOTES:

1. While waiting for the Transfer Complete interrupt, the Host Driver shall only issue commands that do not use the busy signal.
2. The Host Driver shall judge the Auto CMD12(Stop Command) complete by monitoring Transfer Complete.
3. When the last block of un-protected area is read using memory multiple blocks read command (CMD18), OUT\_OF\_RANGE error may occur even if the sequence is correct. The Host Driver should ignore it. This error will appear in the response of Auto CMD12 or in the response of the next memory command.

Figure 21-10. Command Complete Sequence

#### 4.11 TRANSACTION CONTROL WITH DATA TRANSFER USING DAT LINE

Depending on whether DMA (optional) is used or not, there are two execution methods. The sequence not using DMA is shown in Figure 21-11 and the sequence using DMA is shown in Figure 21-12.

In addition, the sequences for SD transfers are basically classified into following three kinds according to how the number of blocks is specified :

1) Single Block Transfer:

The number of blocks is specified to the Host Controller before the transfer. The number of blocks specified is always one.

2) Multiple Block Transfer:

The number of blocks is specified to the Host Controller before the transfer. The number of blocks specified shall be one or more.

3) Infinite Block Transfer:

The number of blocks is not specified to the Host Controller before the transfer. This transfer is continued until an abort transaction is executed. This abort transaction is performed by CMD12(Stop Command) in the case of a SD memory card, and by CMD52(IO\_RW\_DIRECT) in the case of a SDIO card.

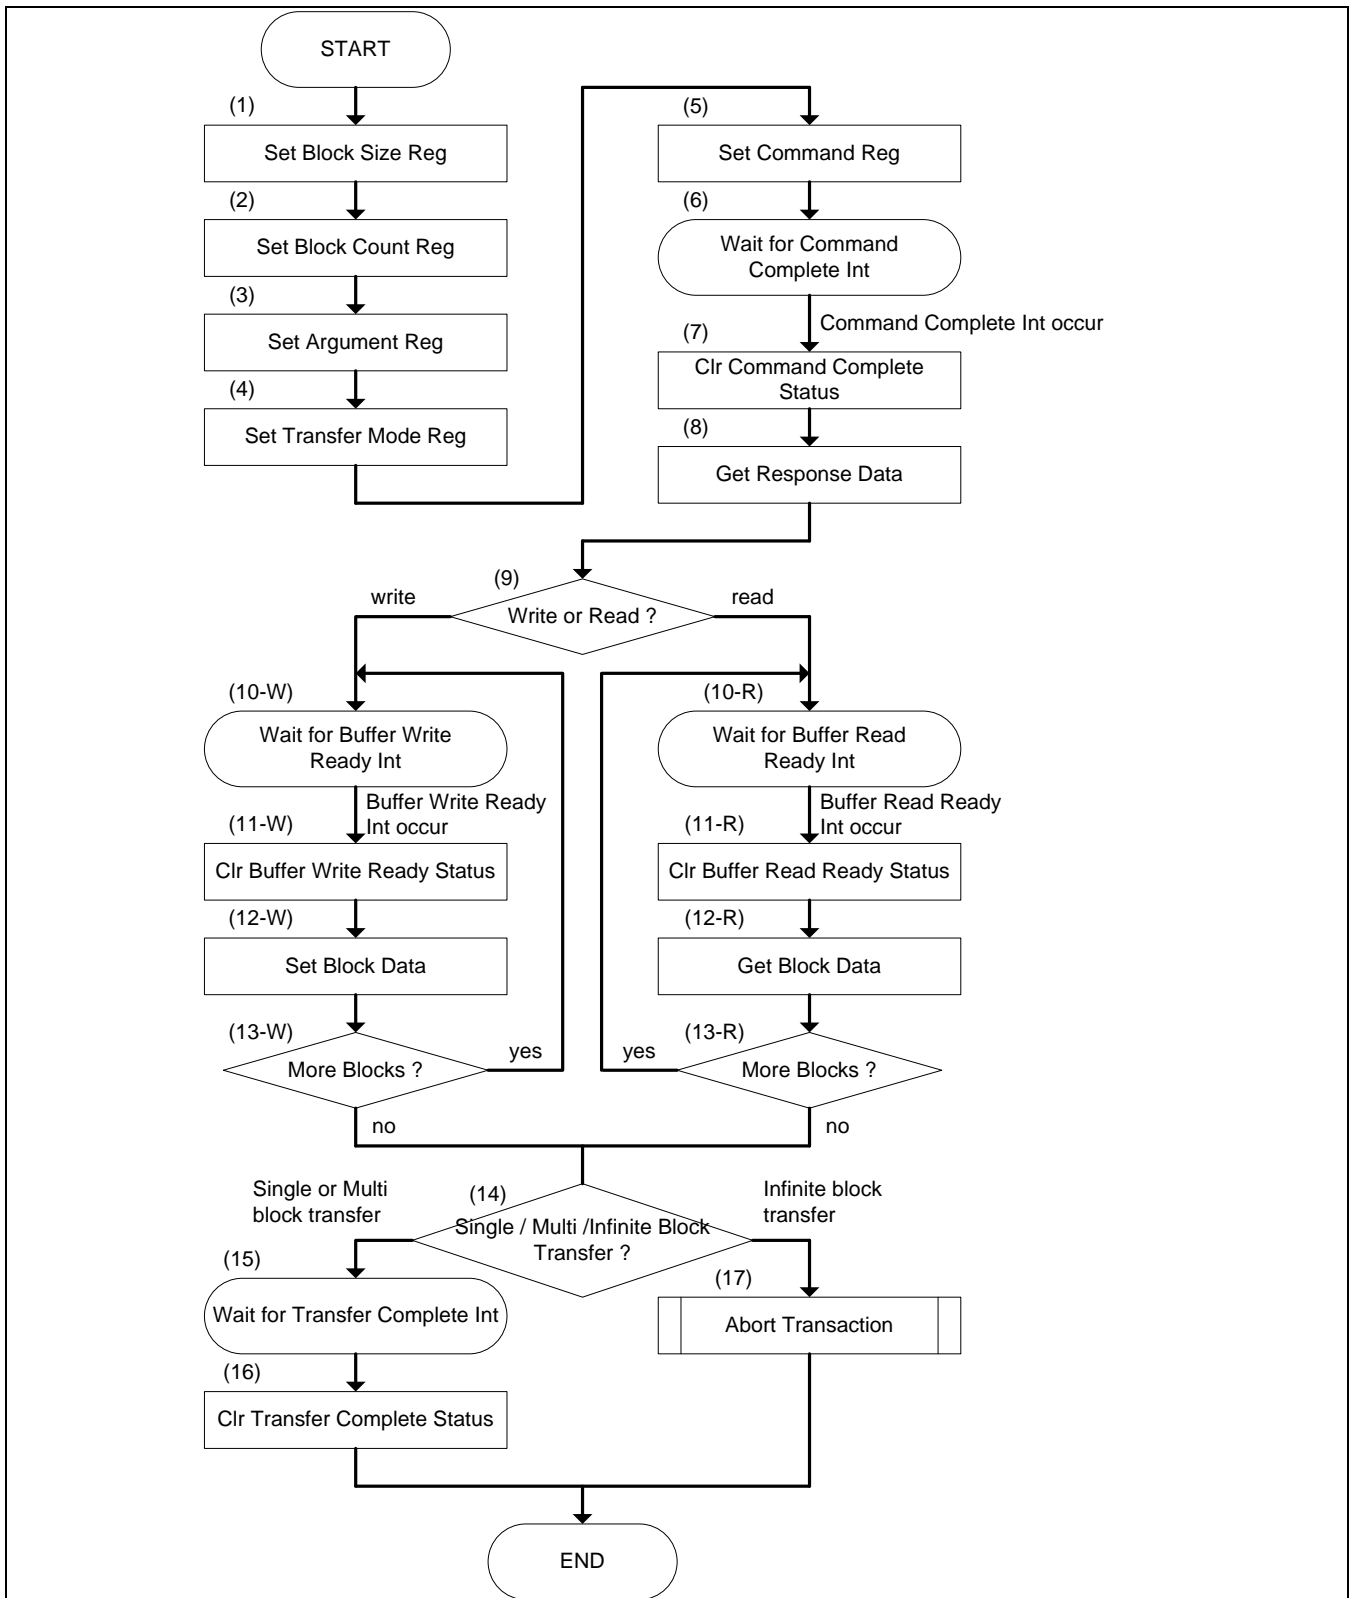

Figure 21-11. Transaction Control with Data Transfer Using DAT Line Sequence (Not using DMA)

- (1) Set the value corresponding to the executed data byte length of one block to Block Size register.
- (2) Set the value corresponding to the executed data block count to Block Count Register.
- (3) Set the value corresponding to the issued command to Argument register.
- (4) Set the value to Multi / Single Block Select and Block Count Enable. And at this time, set the value corresponding to the issued command to Data Transfer Direction, Auto CMD12 Enable and DMA Enable.
- (5) Set the value corresponding to the issued command to Command register.

**NOTE:** When writing the upper byte of Command register, SD command is issued.

- (6) And then, wait for the Command Complete Interrupt.
- (7) Write 1 to the Command Complete(STACMDCMPLT) in the Normal Interrupt Status register for clearing this bit.
- (8) Read Response register and get necessary information in accordance with the issued command.
- (9) In the case where this sequence is for write to a card, go to step (10-W). In case of read from a card, go to step (10-R).
- (10-W) And then wait for Buffer Write Ready Interrupt.
- (11-W) Write 1 to the Buffer Write Ready(STABUFWTRDY) in the Normal Interrupt Status register for clearing this bit.
- (12-W) Write block data (in according to the number of bytes specified at the step (1)) to Buffer Data Port register.
- (13-W) Repeat until all blocks are sent and then go to step (14).
- (10-R) And then wait for the Buffer Read Ready Interrupt.
- (11-R) Write 1 to the Buffer Read Ready(STABUFRDRDY) in the Normal Interrupt Status register for clearing this bit.
- (12-R) Read block data (in according to the number of bytes specified at the step (1)) from the Buffer Data Port register.
- (13-R) Repeat until all blocks are received and then go to step (14).
- (14) If this sequence is for Single or Multiple Block Transfer, go to step (15). In case of Infinite Block Transfer, go to step (17).
- (15) Wait for Transfer Complete Interrupt.
- (16) Write 1 to the Transfer Complete(STATRANCMPLT) in the Normal Interrupt Status register for clearing this bit.
- (17) Perform the sequence for Abort Transaction.

**NOTE:** Step (1) and Step (2) can be executed at same time. Step (4) and Step (5) can be executed at same time

**Figure 21-12. Transaction Control with Data Transfer Using DAT Line Sequence (Using DMA)**

- (1) Set the system address for DMA in the System Address register.
- (2) Set the value corresponding to the executed data byte length of one block in the Block Size register.
- (3) Set the value corresponding to the executed data block count in the Block Count register(BLKCNT).
- (4) Set the value corresponding to the issued command in the Argument register(ARGUMENT).
- (5) Set the values for Multi / Single Block Select and Block Count Enable.

And at this time, set the value corresponding to the issued command for Data Transfer Direction, Auto CMD12 Enable and DMA Enable.

- (6) Set the value corresponding to the issued command in the Command register(CMDREG).

**NOTE:** When writing to the upper byte of the Command register, the SD command is issued and DMA is started.

- (7) And then wait for the Command Complete Interrupt.
- (8) Write 1 to the Command Complete(STACMDCMPLT) in the Normal Interrupt Status register to clear this bit.
- (9) Read Response register and get necessary information in accordance with the issued command.

(10) Wait for the Transfer Complete Interrupt and DMA Interrupt.

(11) If Transfer Complete (STATRANCMPLT) is set 1, go to Step (14) else if DMA Interrupt is set to 1, go to Step (12). Transfer Complete is higher priority than DMA Interrupt.

(12) Write 1 to the DMA Interrupt in the Normal Interrupt Status register to clear this bit.

(13) Set the next system address of the next data position to the System Address register and go to Step (10).

(14) Write 1 to the Transfer Complete and DMA Interrupt in the Normal Interrupt Status register to clear this bit.

**NOTE:** Step (2) and Step (3) can be executed simultaneously. Step (5) and Step (6) can also be executed simultaneously.

#### 4.12 ABORT TRANSACTION

An abort transaction is performed by issuing CMD12 for a SD memory card and by issuing CMD52 for a SDIO card. There are two cases where the Host Driver needs to do an Abort Transaction. The first case is when the Host Driver stops Infinite Block Transfers. The second case is when the Host Driver stops transfers while a Multiple Block Transfer is executing.

There are two ways to issue an Abort Command. The first is an asynchronous abort. The second is a synchronous abort. In an asynchronous abort sequence, the Host Driver can issue an Abort Command at anytime unless **Command Inhibit (CMD)** in the *Present State* register is set to 1. In a synchronous abort, the Host Driver shall issue an Abort Command after the data transfer stopped by using **Stop At Block Gap Request** in the *Block Gap Control* register.

## 5 SDI SPECIAL REGISTERS

### 5.1 CONFIGURATION REGISTER TYPES

Configuration register fields are assigned one of the attributes described below :

| Register Attribute | Description   |
|--------------------|---|
| RO                 | Read-only register: Register bits are read-only and cannot be altered by software or any reset operation. Writes to these bits are ignored.   |
| ROC                | Read-only status : These bits are initialized to zero at reset. Writes to these bits are ignored.   |
| RW or R/W          | Read-write register : Register bits are read-write and may be either set or cleared by software to the desired state.   |
| RW1C               | Read-only status, Write-1-to-clear status: Register bits indicate status when read, a set bit indicating a status event may be cleared by writing a 1. Writing a 0 to RW1C bits has no effect.  |
| RWAC               | Read-Write, automatic clear register: The Host Driver requests a Host Controller operation by setting the bit. The Host Controllers shall clear the bit automatically when the operation of complete. Writing a 0 to RWAC bits has no effect. |
| HWInit             | Hardware Initialized: Register bits are initialized by firmware or hardware mechanisms such as pin strapping or serial EEPROM. Bits are read-only after initialization, and writes to these bits are ignored.                                 |
| Rsvd or Reserved   | Reserved. These bits are initialized to zero, and writes to them are ignored.   |

|             | Address     |
|-------------|-------------|
| HSMMC0_BASE | 0x4AC0_0000 |
| HSMMC1_BASE | 0x4A80_0000 |

## 5.2 SDMA SYSTEM ADDRESS REGISTER

| Register | Address    | R/W | Description                         | Reset Value |
|----------|------------|-----|-------------------------------------|-------------|
| SYSAD0   | 0X4AC00000 | R/W | System Address register (Channel 0) | 0x0         |
| SYSAD1   | 0X4A800000 | R/W | System Address register (Channel 1) | 0x0         |

This register contains the physical system memory address used for DMA transfers.

| Name  | Bit    | Description   | Initial Value |
|-------|--------|---|---------------|
| SYSAD | [31:0] | <p><b>SDMA System Address</b></p> <p>This register contains the system memory address for a DMA transfer. When the Host Controller stops a DMA transfer, this register shall point to the system address of the next contiguous data position. It can be accessed only if no transaction is executing (i.e., after a transaction has stopped). Read operations during transfers may return an invalid value.</p> <p>The Host Driver shall initialize this register before starting a DMA transaction. After DMA has stopped, the next system address of the next contiguous data position can be read from this register.</p> <p>The DMA transfer waits at the every boundary specified by the <b>Host SDMA Buffer Boundary</b> in the <i>Block Size</i> register. The Host Controller generates <b>DMA Interrupt</b> to request the Host Driver to update this register. The Host Driver set the next system address of the next data position to this register. When the most upper byte of this register (003h) is written, the Host Controller restarts the DMA transfer. When restarting DMA by the Resume command or by setting <b>Continue Request</b> in the <i>Block Gap Control</i> register, the Host Controller shall start at the next contiguous address stored here in the <i>System Address</i> register.</p> | 0x00          |

### 5.3 BLOCK SIZE REGISTER

This register is used to configure the number of bytes in a data block.

| Register | Address    | R/W | Description   | Reset Value |
|----------|------------|-----|---|-------------|
| BLKSIZE0 | 0X4AC00004 | R/W | Host DMA Buffer Boundary and Transfer Block Size Register (Channel 0) | 0x0         |
| BLKSIZE1 | 0X4A800004 | R/W | Host DMA Buffer Boundary and Transfer Block Size Register (Channel 1) | 0x0         |

| Name     | Bit     | Description  | Initial Value |
|----------|---------|--|---------------|
|          | [15]    | Reserved   | 0             |
| BUFBOUND | [14:12] | <p><b>Host DMA Buffer Boundary</b></p> <p>The large contiguous memory space may not be available in the virtual memory system. To perform long DMA transfer, <i>System Address</i> register shall be updated at every system memory boundary during DMA transfer. These bits specify the size of contiguous buffer in the system memory. The DMA transfer shall wait at the every boundary specified by these fields and the Host Controller generates the <b>DMA Interrupt</b> to request the Host Driver to update the <i>System Address</i> register.</p> <p>In case of this register is set to 0 (buffer size = 4K bytes), lower 12-bit of byte address points data in the contiguous buffer and the upper 20-bit points the location of the buffer in the system memory. The DMA transfer stops when the Host Controller detects carry out of the address from bit 11 to 12.</p> <p>These bits shall be supported when the <b>DMA Support</b> in the <i>Capabilities</i> register is set to 1 and this function is active when the <b>DMA Enable</b> in the <i>Transfer Mode</i> register is set to 1.</p> <p>000b = 4K bytes (Detects A11 carry out)<br/>           001b = 8K bytes (Detects A12 carry out)<br/>           010b = 16K Bytes (Detects A13 carry out)<br/>           011b = 32K Bytes (Detects A14 carry out)<br/>           100b = 64K bytes (Detects A15 carry out)<br/>           101b = 128K Bytes (Detects A16 carry out)<br/>           110b = 256K Bytes (Detects A17 carry out)<br/>           111b = 512K Bytes (Detects A18 carry out)</p> | 0             |

| Name    | Bit    | Description  | Initial Value |
|---------|--------|--|---------------|
| BLKSIZE | [11:0] | <p><b>Transfer Block Size</b></p> <p>This register specifies the block size of data transfers for CMD17, CMD18, CMD24, CMD25, and CMD53. Values ranging from 1 up to the maximum buffer size can be set. In case of memory, it shall be set up to 512 bytes. It can be accessed only if no transaction is executing (i.e., after a transaction has stopped). Read operations during transfers may return an invalid value, and write operations shall be ignored.</p> <p>0200h = 512 Bytes<br/>01FFh = 511 Bytes<br/>...<br/>0004h = 4 Bytes<br/>0003h = 3 Bytes<br/>0002h = 2 Bytes<br/>0001h = 1 Byte<br/>0000h = No data transfer</p> | 0             |

## 5.4 BLOCK COUNT REGISTER

This register is used to configure the number of data blocks.

| Register | Address    | R/W | Description                                   | Reset Value |
|----------|------------|-----|---|-------------|
| BLKCNT0  | 0X4AC00006 | R/W | Blocks Count For Current Transfer (Channel 0) | 0x0         |
| BLKCNT1  | 0X4A800006 | R/W | Blocks Count For Current Transfer (Channel 1) | 0x0         |

| Name   | Bit    | Description  | Initial Value |
|--------|--------|--|---------------|
| BLKCNT | [15:0] | <p><b>Blocks Count For Current Transfer</b></p> <p>This register is enabled when <b>Block Count Enable</b> in the <i>Transfer Mode</i> register is set to 1 and is valid only for multiple block transfers. The Host Driver shall set this register to a value between 1 and the maximum block count. The Host Controller decrements the block count after each block transfer and stops when the count reaches zero. Setting the block count to 0 results in no data blocks being transferred.</p> <p>This register should be accessed only when no transaction is executing (i.e., after transactions are stopped). During data transfer, read operations on this register may return an invalid value and write operations are ignored. When saving transfer context as a result of a Suspend command, the number of blocks yet to be transferred can be determined by reading this register. When restoring transfer context prior to issuing a Resume command, the Host Driver shall restore the previously saved block count.</p> <p>FFFFh = 65535 blocks<br/>           ... ..<br/>           0002h = 2 blocks<br/>           0001h = 1 block<br/>           0000h = Stop Count</p> | 0             |

## 5.5 ARGUMENT REGISTER

This register contains the SD Command Argument.

| Register  | Address    | R/W | Description                           | Reset Value |
|-----------|------------|-----|---------------------------------------|-------------|
| ARGUMENT0 | 0X4AC00008 | R/W | Command Argument Register (Channel 0) | 0x0         |
| ARGUMENT1 | 0X4A800008 | R/W | Command Argument Register (Channel 1) | 0x0         |

| Name     | Bit    | Description  | Initial Value |
|----------|--------|--|---------------|
| ARGUMENT | [31:0] | <b>Command Argument</b><br>The SD Command Argument is specified as bit39-8 of Command-Format in the SD Memory Card Physical Layer Specification. | 0             |

## 5.6 TRANSFER MODE REGISTER

This register is used to control the operation of data transfers. The Host Driver shall set this register before issuing a command which transfers data (see **Data Present Select** in the *Command* register), or before issuing a Resume command. The Host Driver shall save the value of this register when the data transfer is suspended (as a result of a Suspend command) and restore it before issuing a Resume command. To prevent data loss, the Host Controller shall implement write protection for this register during data transactions. Writes to this register shall be ignored when the **Command Inhibit (DAT)** in the *Present State* register is 1.

| Register | Address    | R/W | Description                                | Reset Value |
|----------|------------|-----|--|-------------|
| TRNMOD0  | 0X4AC0000C | R/W | Transfer Mode Setting Register (Channel 0) | 0x0         |
| TRNMOD1  | 0X4A80000C | R/W | Transfer Mode Setting Register (Channel 1) | 0x0         |

| Name     | Bit     | Description  | Initial Value |
|----------|---------|--|---------------|
|          | [15:10] | <b>Reserved</b>  | 0             |
| CCSCON   | [9:8]   | <b>Command Completion Signal Control</b><br>00 = No CCS Operation (Normal operation, Not CE-ATA mode)<br>01 = Read or Write data transfer CCS enable (Only CE-ATA mode)<br>10 = Without data transfer CCS enable (Only CE-ATA mode)<br>11 = Abort Completion Signal (ACS) generation (Only CE-ATA mode)  | 0             |
|          | [7:6]   | <b>Reserved</b>  | 0             |
| MUL1SIN0 | [5]     | <b>Multi / Single Block Select</b><br>This bit enables multiple block DAT line data transfers. For any other commands, this bit shall be set to 0. If this bit is 0, it is not necessary to set the <i>Block Count</i> register. (Refer to the Table below " <b>Determination of Transfer Type</b> ")<br>1 = Multiple Block<br>0 = Single Block                        | 0             |
| RD1WT0   | [4]     | <b>Data Transfer Direction Select</b><br>This bit defines the direction of DAT line data transfers. The bit is set to 1 by the Host Driver to transfer data from the SD card to the SD Host Controller and it is set to 0 for all other commands.<br>1 = Read (Card to Host)<br>0 = Write (Host to Card)   | 0             |
|          | [3]     | <b>Reserved</b>  | 0             |
| ENACMD12 | [2]     | <b>Auto CMD12 Enable</b><br>Multiple block transfers for memory require CMD12 to stop the transaction.<br>When this bit is set to 1, the Host Controller shall issue CMD12 automatically when last block transfer is completed. The Host Driver shall not set this bit to issue commands that do not require CMD12 to stop data transfer.<br>1 = Enable<br>0 = Disable | 0             |

| Name     | Bit | Description  | Initial Value |
|----------|-----|--|---------------|
| ENBLKCNT | [1] | <p><b>Block Count Enable</b></p> <p>This bit is used to enable the <i>Block Count</i> register, which is only relevant for multiple block transfers. When this bit is 0, the <i>Block Count</i> register is disabled, which is useful in executing an infinite transfer. (Refer to the Table below "<b>Determination of Transfer Type</b>" )</p> <p>1 = Enable<br/>0 = Disable</p>   | 0             |
| ENDMA    | [0] | <p><b>DMA Enable</b></p> <p>This bit enables DMA functionality. DMA can be enabled only if it is supported as indicated in the <b>DMA Support</b> in the <i>Capabilities</i> register. If DMA is not supported, this bit is meaningless and shall always read 0. If this bit is set to 1, a DMA operation shall begin when the Host Driver writes to the upper byte of <i>Command</i> register (00Fh).</p> <p>1 = Enable<br/>0 = Disable</p> | 0             |

Table below shows the summary of how register settings determine types of data transfer.

**Table 21-1. Determination of Transfer Type**

| Multi/Single Block Select | Block Count Enable | <i>Block Count</i> | Function               |
|---------------------------|--------------------|--------------------|------------------------|
| 0                         | Don't care         | Don't care         | Single Transfer        |
| 1                         | 0                  | Don't care         | Infinite Transfer      |
| 1                         | 1                  | Not Zero           | Multiple Transfer      |
| 1                         | 1                  | Zero               | Stop Multiple Transfer |

**NOTE:** For CE-ATA access, (Auto) CMD12 should be issued after Command Completion Signal Disable

## 5.7 COMMAND REGISTER

This register contains the SD Command Argument.

| Register | Address    | R/W | Description                  | Reset Value |
|----------|------------|-----|------------------------------|-------------|
| CMDREG0  | 0X4AC0000E | R/W | Command Register (Channel 0) | 0x0         |
| CMDREG1  | 0X4A80000E | R/W | Command Register (Channel 1) | 0x0         |

The Host Driver shall check the **Command Inhibit (DAT)** bit and **Command Inhibit (CMD)** bit in the *Present State* register before writing to this register. Writing to the upper byte of this register triggers SD command generation. The Host Driver has the responsibility to write this register because the Host Controller does not protect for writing when **Command Inhibit (CMD)** is set.

| Name   | Bit     | Description  | Initial Value |
|--------|---------|--|---------------|
|        | [15:14] | <b>Reserved</b>  |               |
| CMDIDX | [13:8]  | <p><b>Command Index</b></p> <p>These bits shall be set to the command number (CMD0-63, ACMD0-63) that is specified in bits 45-40 of the Command-Format in the SD Memory Card Physical Layer Specification and SDIO Card Specification.</p>   |               |
| CMDTYP | [7:6]   | <p><b>Command Type</b></p> <p>There are three types of special commands: Suspend, Resume and Abort.</p> <p>These bits <b>shall</b> be set to 00b for all other commands.</p> <ul style="list-style-type: none"> <li>• Suspend Command</li> </ul> <p>If the Suspend command succeeds, the Host Controller shall assume the SD Bus has been released and that it is possible to issue the next command which uses the <b>DAT</b> line. The Host Controller shall de-assert Read Wait for read transactions and stop checking busy for write transactions. The interrupt cycle shall start, in 4-bit mode. If the Suspend command fails, the Host Controller shall maintain its current state, and the Host Driver shall restart the transfer by setting <b>Continue Request</b> in the <i>Block Gap Control</i> register.</p> <ul style="list-style-type: none"> <li>• Resume Command</li> </ul> <p>The Host Driver re-starts the data transfer by restoring the registers in the range of 000-00Dh. (Refer to Suspend and Resume mechanism)<br/>The Host Controller shall check for busy before starting write transfers.</p> <ul style="list-style-type: none"> <li>• Abort Command</li> </ul> <p>If this command is set when executing a read transfer, the Host Controller shall stop reads to the buffer. If this command is set when executing a write transfer, the Host Controller shall stop driving the <b>DAT</b> line. After issuing the Abort command, the Host Driver should issue a software reset. (Refer to Abort Transaction)</p> <p>11b = Abort CMD12, CMD52 for writing "I/O Abort" in CCCR<br/>10b = Resume CMD52 for writing "Function Select" in CCCR<br/>01b = Suspend CMD52 for writing "Bus Suspend" in CCCR<br/>00b = Normal Other commands</p> |               |

| Name         | Bit   | Description   | Initial Value |
|--------------|-------|---|---------------|
| DATAPRNT     | [5]   | <p><b>Data Present Select</b></p> <p>This bit is set to 1 to indicate that data is present and shall be transferred using the <b>DAT</b> line. It is set to 0 for the following:</p> <p>(1) Commands using only <b>CMD</b> line (ex. CMD52).</p> <p>(2) Commands with no data transfer but using busy signal on <b>DAT[0]</b> line (R1b or R5b ex. CMD38)</p> <p>(3) Resume command</p> <p>1 = Data Present<br/>0 = No Data Present</p> |               |
| ENCMDIDX     | [4]   | <p><b>Command Index Check Enable</b></p> <p>If this bit is set to 1, the Host Controller shall check the Index field in the response to see if it has the same value as the command index. If it is not, it is reported as a Command Index Error. If this bit is set to 0, the Index field is not checked.</p> <p>1 = Enable<br/>0 = Disable</p>  |               |
| ENCMDCR<br>C | [3]   | <p><b>Command CRC Check Enable</b></p> <p>If this bit is set to 1, the Host Controller shall check the CRC field in the response. If an error is detected, it is reported as a Command CRC Error. If this bit is set to 0, the CRC field is not checked. The number of bits checked by the CRC field value changes according to the length of the response.</p> <p>1 = Enable<br/>0 = Disable</p>                                       |               |
|              | [2]   | <b>Reserved</b>   |               |
| RSPTYP       | [1:0] | <p><b>Response Type Select</b></p> <p>00 = No Response<br/>01 = Response Length 136<br/>10 = Response Length 48<br/>11 = Response Length 48 check Busy after response</p>   |               |

Table 21-2. Relation Between Parameters and the Name of Response Type

| Response Type | Index Check Enable | CRC Check Enable | Name of Response Type |
|---------------|--------------------|------------------|-----------------------|
| 00            | 0                  | 0                | No Response           |
| 01            | 0                  | 1                | R2                    |
| 10            | 0                  | 0                | R3, R4                |
| 10            | 1                  | 1                | R1, R6, R5, R7        |
| 11            | 1                  | 1                | R1b, R5b              |

These bits determine Response types.

**NOTES:**

1. In the SDIO specification, response type notation of R5b is not defined. R5 includes R5b in the SDIO specification. But R5b is defined in this specification to specify the Host Controller shall check busy after receiving response. For example, usually CMD52 is used as R5 but I/O abort command shall be used as R5b.
2. For CMD52 to read BS after writing "Bus Suspend," Command Type should be "Suspend" as well.

**5.8 RESPONSE REGISTER**

This register is used to store responses from SD cards.

| Register  | Address    | R/W | Description                     | Reset Value |
|-----------|------------|-----|---------------------------------|-------------|
| RSPREG0_0 | 0X4AC00010 | ROC | Response Register 0 (Channel 0) | 0x0         |
| RSPREG1_0 | 0X4AC00014 | ROC | Response Register 1 (Channel 0) | 0x0         |
| RSPREG2_0 | 0X4AC00018 | ROC | Response Register 2 (Channel 0) | 0x0         |
| RSPREG3_0 | 0X4AC0001C | ROC | Response Register 3 (Channel 0) | 0x0         |
| Register  | Address    | R/W | Description                     | Reset Value |
| RSPREG0_1 | 0X4A800010 | ROC | Response Register 0 (Channel 1) | 0x0         |
| RSPREG1_1 | 0X4A800014 | ROC | Response Register 1 (Channel 1) | 0x0         |
| RSPREG2_1 | 0X4A800018 | ROC | Response Register 2 (Channel 1) | 0x0         |
| RSPREG3_1 | 0X4A80001C | ROC | Response Register 3 (Channel 1) | 0x0         |

| Name   | Bit     | Description   | Initial Value |
|--------|---------|---|---------------|
| CMDRSP | [127:0] | <b>Command Response</b><br>The Table below describes the mapping of command responses from the SD Bus to this register for each response type. In the table, R[] refers to a bit range within the response data as transmitted on the SD Bus, REP[] refers to a bit range within the <i>Response</i> register.<br>128-bit Response bit order : {RSPREG3, RSPREG2, RSPREG1, RSPREG0} |               |

**Table 21-3. Response Bit Definition for Each Response Type.**

| Kind of Response            | Meaning of Response          | Response Field | Response Register |
|-----------------------------|------------------------------|----------------|-------------------|
| R1, R1b (normal response)   | Card Status                  | R [39:8]       | REP [31:0]        |
| R1b (Auto CMD12 response)   | Card Status for Auto CMD12   | R [39:8]       | REP [127:96]      |
| R2 (CID, CSD register)      | CID or CSD reg. incl.        | R [127:8]      | REP [119:0]       |
| R3 (OCR register)           | OCR register for memory      | R [39:8]       | REP [31:0]        |
| R4 (OCR register)           | OCR register for I/O etc     | R [39:8]       | REP [31:0]        |
| R5,R5b                      | SDIO response                | R [39:8]       | REP [31:0]        |
| R6 (Published RCA response) | New published RCA[31:16] etc | R [39:8]       | REP [31:0]        |
| R7                          | ?                            | R [39:8]       | REP [31:0]        |

The Response Field indicates bit positions of “Responses” defined in the PHYSICAL LAYER SPECIFICATION Version 1.01. The Table (upper) shows that most responses with a length of 48 (R[47:0]) have 32 bits of the response data (R[39:8]) stored in the *Response* register at REP[31:0]. Responses of type R1b (Auto CMD12 responses) have response data bits R[39:8] stored in the *Response* register at REP[127:96]. Responses with length 136 (R[135:0]) have 120 bits of the response data (R[127:8]) stored in the *Response* register at REP[119:0].

To be able to read the response status efficiently, the Host Controller only stores part of the response data in the *Response* register. This enables the Host Driver to efficiently read 32 bits of response data in one read cycle on a 32-bit bus system. Parts of the response, the Index field and the CRC, are checked by the Host Controller (as specified by the **Command Index Check Enable** and the **Command CRC Check Enable** bits in the *Command* register) and generate an error interrupt if an error is detected. The bit range for the CRC check depends on the response length. If the response length is 48, the Host Controller shall check R[47:1], and if the response length is 136 the Host Controller shall check R[119:1].

Since the Host Controller may have a multiple block data DAT line transfer executing concurrently with a CMD\_wo\_DAT command, the Host Controller stores the Auto CMD12 response in the upper bits (REP[127:96]) of the *Response* register. The CMD\_wo\_DAT response is stored in REP[31:0]. This allows the Host Controller to avoid overwriting the Auto CMD12 response with the CMD\_wo\_DAT and vice versa.

When the Host Controller modifies part of the *Response* register, as shown in the Table above, it shall preserve the unmodified bits.

**NOTE:** CMD\_wo\_DAT (Command without Data line) means the command not to use data line. The command set of this type depends on the card type (MMC, SD/SDIO or CE-ATA). Generally, the command using data line receives contents through “Buffer Data Port Register”, but the command without using data line receives contents through “RESPONSE register” in the Host Controller.

### 5.9 BUFFER DATA PORT REGISTER

32-bit data port register to access internal buffer.

| Register | Address    | R/W | Description                      | Reset Value |
|----------|------------|-----|----------------------------------|-------------|
| BDATA0   | 0X4AC00020 | R/W | Buffer Data Register (Channel 0) | –           |
| BDATA1   | 0X4A800020 | R/W | Buffer Data Register (Channel 1) | –           |

| Name   | Bit    | Description   | Initial Value |
|--------|--------|---|---------------|
| BUFDAT | [31:0] | <b>Buffer Data</b><br>The Host Controller buffer can be accessed through this 32-bit <i>Data Port</i> register. | –             |

Detailed documents are to be copied from SD Host Standard Spec.

## 5.10 PRESENT STATE REGISTER

This register contains the SD Command Argument.

| Register | Address    | R/W    | Description                        | Reset Value |
|----------|------------|--------|------------------------------------|-------------|
| PRNSTS0  | 0X4AC00024 | RO/ROC | Present State Register (Channel 0) | 0x000A0000  |
| PRNSTS1  | 0X4A800024 | RO/ROC | Present State Register (Channel 1) | 0x000A0000  |

| Name     | Bit     | Description  | Initial Value      |
|----------|---------|--|--------------------|
|          | [31:25] | <b>Reserved</b>  | 0                  |
| PRNTCMD  | [24]    | <b>CMD Line Signal Level (RO)</b><br>This status is used to check the <b>CMD</b> line level to recover from errors, and for debugging.<br><b>Note:</b> <b>CMD</b> port is mapped to <b>SDx_CMD</b> pin   | 0                  |
| PRNTDAT  | [23:20] | <b>DAT[3:0] Line Signal Level (RO)</b><br>This status is used to check the <b>DAT</b> line level to recover from errors, and for debugging. This is especially useful in detecting the busy signal level from <b>DAT[0]</b> .<br>D23 = DAT[3]<br>D22 = DAT[2]<br>D21 = DAT[1]<br>D20 = DAT[0]<br><b>Note:</b> <b>DAT</b> port is mapped to <b>SDx_DAT</b> pin  | Line State         |
| PRNTWP   | [19]    | <b>Write Protect Switch Pin Level (RO)</b><br>The Write Protect Switch is supported for memory and combo cards. This bit reflects the <b>SDWP#</b> pin.<br>1 = Write enabled ( <b>SDWP#=1</b> )<br>0 = Write protected ( <b>SDWP#=0</b> )<br><b>Note:</b> <b>SDWP#</b> of channel 0 is fixed to High.  | 1                  |
| PRNTCD   | [18]    | <b>Card Detect Pin Level (RO)</b><br>This bit reflects the inverse value of the <b>SDCD#</b> pin. Debouncing is not performed on this bit. This bit may be valid when <b>Card State Stable</b> is set to 1, but it is not guaranteed because of propagation delay. Use of this bit is limited to testing since it must be debounced by software.<br>1 = Card present ( <b>SDCD#=0</b> )<br>0 = No card present ( <b>SDCD#=1</b> )<br><b>Note:</b> <b>SDCD#</b> of Channel 0 is fixed to LOW. | Line State         |
| STBLCARD | [17]    | <b>Card State Stable (RO)</b><br>This bit is used for testing. If it is 0, the <b>Card Detect Pin Level</b> is not stable. If this bit is set to 1, it means the <b>Card Detect Pin Level</b> is stable. No Card state can be detected by this bit is set to 1 and <b>Card Inserted</b> is set to 0. The <b>Software Reset For All</b> in the <i>Software Reset</i> register shall not affect this bit.<br>1 = No Card or Inserted   | 1<br>(After Reset) |

| Name     | Bit     | Description  | Initial Value |
|----------|---------|--|---------------|
|          |         | 0 = Reset or Debouncing  |               |
| INSCARD  | [16]    | <p><b>Card Inserted (RO)</b></p> <p>This bit indicates whether a card has been inserted. The Host Controller shall debounce this signal so that the Host Driver will not need to wait for it to stabilize. Changing from 0 to 1 generates a <b>Card Insertion</b> interrupt in the <i>Normal Interrupt Status</i> register and changing from 1 to 0 generates a <b>Card Removal</b> interrupt in the <i>Normal Interrupt Status</i> register. The <b>Software Reset For All</b> in the <i>Software Reset</i> register shall not affect this bit. If a card is removed while its power is on and its clock is oscillating, the Host Controller shall clear <b>SD Bus Power</b> in the <i>Power Control</i> register and <b>SD Clock Enable</b> in the <i>Clock Control</i> register.</p> <p>When this bit is changed from 1 to 0, the Host Controller shall immediately stop driving <b>CMD</b> and <b>DAT[3:0]</b> (tri-state). In addition, the Host Driver should clear the Host Controller by the <b>Software Reset For All</b> in <i>Software Reset</i> register. The card detect is active regardless of the <b>SD Bus Power</b>.</p> <p>1 = Card Inserted<br/>0 = Reset or Debouncing or No Card</p> | 0             |
|          | [15:14] | <b>Reserved</b>  |               |
| DIFF4W   | [13]    | <p><b>FIFO Pointer Difference 4-Word (ROC)</b></p> <p>When the difference of the address pointer between AHB side and SD side is more than or equal to 4-word, this status bit is set to HIGH. When others clears automatically.</p> <p>Write(Tx) mode : when this bit is HIGH, more than or equal to 4-word can be written by CPU side.</p> <p>Read(Rx) mode : when this bit is HIGH, more than or equal to 4-word can be read by CPU side.</p>   | 0             |
| DIFF1W   | [12]    | <p><b>FIFO Pointer Difference 1-Word (ROC)</b></p> <p>When the difference of the address pointer between AHB side and SD side is more than or equal to 1-word, this status bit is set to HIGH. When others clears automatically.</p> <p>Write(Tx) mode : when this bit is HIGH, more than or equal to 1-word can be written by CPU side.</p> <p>Read(Rx) mode : when this bit is HIGH, more than or equal to 1-word can be read by CPU side.</p>   | 0             |
| BUFRDRDY | [11]    | <p><b>Buffer Read Enable (ROC)</b></p> <p>This status is used for non-DMA read transfers. The Host Controller may implement multiple buffers to transfer data efficiently. This read only flag indicates that valid data exists in the host side buffer status. If this bit is 1, readable data exists in the buffer. A change of this bit from 1 to 0 occurs when all the block data is read from the buffer. A change of this bit from 0 to 1 occurs when block data is ready in the buffer and generates the <b>Buffer Read Ready</b> interrupt.</p> <p>1 = Read enable<br/>0 = Read disable</p>  | 0             |

| Name      | Bit  | Description  | Initial Value |
|-----------|------|--|---------------|
| BUFWTRDY  | [10] | <p><b>Buffer Write Enable (ROC)</b></p> <p>This status is used for non-DMA write transfers. The Host Controller can implement multiple buffers to transfer data efficiently. This read only flag indicates if space is available for write data. If this bit is 1, data can be written to the buffer. A change of this bit from 1 to 0 occurs when all the block data is written to the buffer. A change of this bit from 0 to 1 occurs when top of block data can be written to the buffer and generates the <b>Buffer Write Ready</b> interrupt.</p> <p>1 = Write enable<br/>0 = Write disable</p>   | 0             |
| RDTRANACT | [9]  | <p><b>Read Transfer Active (ROC)</b></p> <p>This status is used for detecting completion of a read transfer.</p> <p>This bit is set to 1 for either of the following conditions:</p> <ol style="list-style-type: none"> <li>(1) After the end bit of the read command.</li> <li>(2) When writing a 1 to <b>Continue Request</b> in the <i>Block Gap Control</i> register to restart a read transfer.</li> </ol> <p>This bit is cleared to 0 for either of the following conditions::</p> <ol style="list-style-type: none"> <li>(1) When the last data block as specified by block length is transferred to the System.</li> <li>(2) When all valid data blocks have been transferred to the System and no current block transfers are being sent as a result of the <b>Stop At Block Gap Request</b> being set to 1. <b>A Transfer Complete</b> interrupt is generated when this bit changes to 0.</li> </ol> <p>1 = Transferring data<br/>0 = No valid data</p>  | 0             |
| WTTRANACT | [8]  | <p><b>Write Transfer Active (ROC)</b></p> <p>This status indicates a write transfer is active. If this bit is 0, it means no valid write data exists in the Host Controller.</p> <p>This bit is set in either of the following cases:</p> <ol style="list-style-type: none"> <li>(1) After the end bit of the write command.</li> <li>(2) When writing a 1 to <b>Continue Request</b> in the <i>Block Gap Control</i> register to restart a write transfer.</li> </ol> <p>This bit is cleared in either of the following cases:</p> <ol style="list-style-type: none"> <li>(1) After getting the CRC status of the last data block as specified by the transfer count (Single and Multiple)</li> <li>(2) After getting the CRC status of any block where data transmission is about to be stopped by a <b>Stop At Block Gap Request</b>.</li> </ol> <p>During a write transaction, a <b>Block Gap Event</b> interrupt is generated when this bit is changed to 0, as result of the <b>Stop At Block Gap Request</b> being set. This status is useful for the Host Driver in determining when to issue commands during write busy.</p> <p>1 = Transferring data<br/>0 = No valid data</p> | 0             |

|------------|-------|---|---------------|
|            | [7:3] | <b>Reserved</b>   | 0             |
| DATLINEACT | [2]   | <p><b>DAT Line Active (ROC)</b></p> <p>This bit indicates whether one of the <b>DAT</b> line on SD Bus is in use.</p> <p><b>(a) In the case of read transactions</b></p> <p>This status indicates if a read transfer is executing on the SD Bus. Changes in this value from 1 to 0 between data blocks generate a <b>Block Gap Event</b> interrupt in the <i>Normal Interrupt Status</i> register.</p> <p>This bit shall be set in either of the following cases:</p> <ol style="list-style-type: none"> <li>(1) After the end bit of the read command.</li> <li>(2) When writing a 1 to <b>Continue Request</b> in the <i>Block Gap Control</i> register to restart a read transfer.</li> </ol> <p>This bit shall be cleared in either of the following cases:</p> <ol style="list-style-type: none"> <li>(1) When the end bit of the last data block is sent from the SD Bus to the Host Controller.</li> <li>(2) When beginning a wait read transfer at a stop at the block gap initiated by a <b>Stop At Block Gap Request</b>.</li> </ol> <p>The Host Controller shall wait at the next block gap by driving Read Wait at the start of the interrupt cycle. If the Read Wait signal is already driven (data buffer cannot receive data), the Host Controller can wait for current block gap by continuing to drive the Read Wait signal. It is necessary to support Read Wait in order to use the suspend / resume function.</p> <p><b>(b) In the case of write transactions</b></p> <p>This status indicates that a write transfer is executing on the SD Bus. Changes in this value from 1 to 0 generate a <b>Transfer Complete</b> interrupt in the <i>Normal Interrupt Status</i> register.</p> <p>This bit shall be set in either of the following cases:</p> <ol style="list-style-type: none"> <li>(1) After the end bit of the write command.</li> <li>(2) When writing to 1 to <b>Continue Request</b> in the <i>Block Gap Control</i> register to continue a write transfer.</li> </ol> <p>This bit shall be cleared in either of the following cases:</p> <ol style="list-style-type: none"> <li>(1) When the SD card releases write busy of the last data block the Host Controller shall also detect if output is not busy. If SD card does not drive busy signal for 8 SD Clocks, the Host Controller shall consider the card drive "Not Busy".</li> <li>(2) When the SD card releases write busy prior to waiting for write transfer as a result of a <b>Stop At Block Gap Request</b>.</li> </ol> <p>1 = DAT Line Active<br/>0 = DAT Line Inactive</p> | 0             |
| CMDINH DAT | [1]   | <p><b>Data Inhibit (DAT) (ROC)</b></p> <p>This status bit is generated if either the <b>DAT Line Active</b> or the <b>Read Transfer Active</b> is set to 1. If this bit is 0, it indicates the Host Controller can issue the next SD Command. Commands with busy signal belong to <b>Command Inhibit (DAT)</b> (ex. R1b, R5b type).</p>   | 0             |

| Name      | Bit | Description  | Initial Value |
|-----------|-----|--|---------------|
|           |     | <p>Changing from 1 to 0 generates a <b>Transfer Complete</b> interrupt in the <i>Normal Interrupt Status</i> register.</p> <p>Note: The SD Host Driver can save registers in the range of 000-00Dh for a suspend transaction after this bit has changed from 1 to 0.</p> <p>1 = Cannot issue command which uses the <b>DAT</b> line<br/>0 = Can issue command which uses the <b>DAT</b> line</p>   |               |
| CMDINHCMD | [0] | <p><b>Command Inhibit (CMD) (ROC)</b></p> <p>If this bit is 0, it indicates the <b>CMD</b> line is not in use and the Host Controller can issue a SD Command using the <b>CMD</b> line.</p> <p>This bit is set immediately after the <i>Command</i> register (00Fh) is written. This bit is cleared when the command response is received. Even if the <b>Command Inhibit (DAT)</b> is set to 1, Commands using only the <b>CMD</b> line can be issued if this bit is 0. Changing from 1 to 0 generates a <b>Command Complete</b> interrupt in the <i>Normal Interrupt Status</i> register. If the Host Controller cannot issue the command because of a command conflict error (Refer to <b>Command CRC Error</b>) or because of <b>Command Not Issued By Auto CMD12 Error</b>, this bit shall remain 1 and the <b>Command Complete</b> is not set. Status issuing Auto CMD12 is not read from this bit.</p> <p>1 = Cannot issue command<br/>0 = Can issue command using only <b>CMD</b> line</p> | 0             |

**NOTE:** Buffer Write Enable in Present register should not be asserted for DMA transfers since it generates Buffer Write Ready interrupt

**Figure 21-13. Card Detect State**

The above Figure shows the state definitions of hardware that handles “Debouncing”.

Figure 21-14. Timing of Command Inhibit (DAT) and Command Inhibit (CMD) with data transfer

Figure 21-16. Timing of Command Inhibit (CMD) for the case of no response command

## 5.11 HOST CONTROL REGISTER

This register contains the SD Command Argument.

| Register | Address    | R/W | Description                        | Reset Value |
|----------|------------|-----|------------------------------------|-------------|
| HOSTCTL0 | 0X4AC00028 | R/W | Present State Register (Channel 0) | 0x0         |
| HOSTCTL1 | 0X4A800028 | R/W | Present State Register (Channel 1) | 0x0         |

| Name      | Bit   | Description  | Initial Value |
|-----------|-------|--|---------------|
| CDSIGSEL  | [7]   | <b>Reserved</b><br>This field should be fixed to LOW   | 0             |
| CDTESTLVL | [6]   | <b>Reserved</b><br>This field should be fixed to LOW   | 0             |
| WIDE8     | [5]   | <b>Extended Data Transfer Width</b> (It is for MMC 8bit card.)<br>1 = 8 bit operation<br>0 = the bit width is designated by the bit 1 (Data Transfer Width)  | 0             |
| DMASEL    | [4:3] | <b>DMA Select</b><br>One of supported DMA modes can be selected. The host driver shall check support of DMA modes by referring the <i>Capabilities</i> register. Use of selected DMA is determined by <b>DMA Enable</b> of the <i>Transfer Mode</i> register.<br>00 = SDMA is selected<br>01 = Reserved<br>10 = 32-bit Address ADMA2 is selected<br>11 = 64-bit Address ADMA2 is selected (Not supported)  | 0             |
| ENHIGHSPD | [2]   | <b>High Speed Enable</b><br>This bit is optional. Before setting this bit, the Host Driver shall check the <b>High Speed Support</b> in the <i>Capabilities</i> register. If this bit is set to 0 (default), the Host Controller outputs <b>CMD</b> line and <b>DAT</b> lines at the falling edge of the SD Clock (up to 25MHz). If this bit is set to 1, the Host Controller outputs <b>CMD</b> line and <b>DAT</b> lines at the rising edge of the SD Clock (up to 50MHz).<br>1 = High Speed mode<br>0 = Normal Speed mode | 0             |
| WIDE4     | [1]   | <b>Data Transfer Width</b><br>This bit selects the data width of the Host Controller. The Host Driver shall set it to match the data width of the SD card.<br>1 = 4-bit mode<br>0 = 1-bit mode   | 0             |
| ONLED     | [0]   | <b>LED Control</b><br>This bit is used to caution the user not to remove the card while the SD card is being accessed. If the software is going to issue multiple SD commands, this bit can be set during all these transactions. It is not necessary to change for each transaction.<br>1 = LED on<br>0 = LED off<br><b>Note:</b> LED port is mapped to <i>SD0_LED</i> pin  | 0             |

**NOTE:** Card Detect Pin Level does not simply reflect SDCD# pin, but chooses from SDCD, DAT[3], or CDTestLvl depending on CDSSigSel and SDCDSel values.

## 5.12 POWER CONTROL REGISTER

This register contains the SD Command Argument.

| Register | Address    | R/W | Description                        | Reset Value |
|----------|------------|-----|------------------------------------|-------------|
| PWRCON0  | 0X4AC00029 | R/W | Present State Register (Channel 0) | 0x0         |
| PWRCON1  | 0X4A800029 | R/W | Present State Register (Channel 1) | 0x0         |

| Name      | Bit   | Description   | Initial Value |
|-----------|-------|---|---------------|
|           | [7:4] | Reserved  |               |
| SELPWRLVL | [3:1] | <p><b>SD Bus Voltage Select</b></p> <p>By setting these bits, the Host Driver selects the voltage level for the SD card. Before setting this register, the Host Driver shall check the <b>Voltage Support</b> bits in the <i>Capabilities</i> register. If an unsupported voltage is selected, the Host System shall not supply SD Bus voltage.</p> <p>111b = 3.3V (Typ.)<br/>           110b = 3.0V (Typ.)<br/>           101b = 1.8V (Typ.)<br/>           100b – 000b = Reserved</p> | 0             |
| PWRON     | [0]   | <p><b>SD Bus Power</b></p> <p>Before setting this bit, the SD Host Driver shall set <b>SD Bus Voltage Select</b>. If the Host Controller detects the No Card state, this bit shall be cleared.</p> <p>If this bit is cleared, the Host Controller shall immediately stop driving <b>CMD</b> and <b>DAT[3:0]</b> (tri-state) and drive <b>SDCLK</b> to low level.</p> <p>1 = Power on<br/>           0 = Power off</p>   | 0             |

### 5.13 BLOCK GAP CONTROL REGISTER

This register contains the SD Command Argument.

| Register | Address    | R/W | Description                            | Reset Value |
|----------|------------|-----|--|-------------|
| BLKGAP0  | 0X4AC0002A | R/W | Block Gap Control Register (Channel 0) | 0x0         |
| BLKGAP1  | 0X4A80002A | R/W | Block Gap Control Register (Channel 1) | 0x0         |

| Name      | Bit   | Description   | Initial Value |
|-----------|-------|---|---------------|
|           | [7:4] | Reserved  | 0             |
| ENINTBGAP | [3]   | <p><b>Interrupt At Block Gap</b></p> <p>This bit is valid only in 4-bit mode of the SDIO card and selects a sample point in the interrupt cycle. Setting to 1 enables interrupt detection at the block gap for a multiple block transfer. Setting to 0 disables interrupt detection during a multiple block transfer. If the SD card cannot signal an interrupt during a multiple block transfer, this bit should be set to 0. When the Host Driver detects an SD card insertion, it shall set this bit according to the CCCR of the SDIO card. (RW)</p> <p>1 = Enabled<br/>0 = Disabled</p>  | 0             |
| ENRWAIT   | [2]   | <p><b>Read Wait Control</b></p> <p>The read wait function is optional for SDIO cards. If the card supports read wait, set this bit to enable use of the read wait protocol to stop read data using the <b>DAT[2]</b> line. Otherwise the Host Controller has to stop the SD Clock to hold read data, which restricts commands generation. When the Host Driver detects an SD card insertion, it shall set this bit according to the CCCR of the SDIO card. If the card does not support read wait, this bit shall never be set to 1 otherwise <b>DAT</b> line conflict may occur. If this bit is set to 0, Suspend/Resume cannot be supported. (RW)</p> <p>1 = Enable Read Wait Control<br/>0 = Disable Read Wait Control</p>   | 0             |
| CONTREQ   | [1]   | <p><b>Continue Request</b></p> <p>This bit is used to restart a transaction which was stopped using the <b>Stop At Block Gap Request</b>. To cancel stop at the block gap, set <b>Stop At Block Gap Request</b> to 0 and set this bit 1 to restart the transfer. The Host Controller automatically clears this bit in either of the following cases:</p> <p>(1) In the case of a read transaction, the <b>DAT Line Active</b> changes from 0 to 1 as a read transaction restarts.</p> <p>(2) In the case of a write transaction, the <b>Write Transfer Active</b> changes from 0 to 1 as the write transaction restarts.</p> <p>Therefore it is not necessary for Host Driver to set this bit to 0. If <b>Stop At Block Gap Request</b> is set to 1, any write to this bit is ignored. (RWAC)</p> <p>1 = Restart<br/>0 = Not affect</p> | 0             |
| STOPBGAP  | [0]   | <b>Stop At Block Gap Request</b>  | 0             |

| Name | Bit | Description  | Initial Value |
|------|-----|--|---------------|
|      |     | <p>This bit is used to stop executing a transaction at the next block gap for both DMA and non-DMA transfers. Until the <b>Transfer Complete</b> is set to 1, indicating a transfer completion the Host Driver shall leave this bit set to 1.</p> <p>Clearing both the <b>Stop At Block Gap Request</b> and <b>Continue Request</b> shall not cause the transaction to restart. Read Wait is used to stop the read transaction at the block gap. The Host Controller shall honor <b>Stop At Block Gap Request</b> for write transfers, but for read transfers it requires that the SD card support Read Wait. Therefore the Host Driver shall not set this bit during read transfers unless the SD card supports Read Wait and has set <b>Read Wait Control</b> to 1. In the case of write transfers in which the Host Driver writes data to the <i>Buffer Data Port</i> register, the Host Driver shall set this bit after all block data is written. If this bit is set to 1, the Host Driver shall not write data to <i>Buffer Data Port</i> register.</p> <p>This bit affects <b>Read Transfer Active, Write Transfer Active, DAT Line Active</b> and <b>Command Inhibit (DAT)</b> in the <i>Present State</i> register. Regarding detailed control of bits D01 and D00. (RW)</p> <p>'1' = Stop<br/>'0' = Transfer</p> |               |

There are three cases to restart the transfer after stop at the block gap. Which case is appropriate depends on whether the Host Controller issues a Suspend command or the SD card accepts the Suspend command.

- (1) If the Host Driver does not issue a Suspend command, the **Continue Request** shall be used to restart the transfer.
- (2) If the Host Driver issues a Suspend command and the SD card accepts it, a Resume command shall be used to restart the transfer.
- (3) If the Host Driver issues a Suspend command and the SD card does not accept it, the **Continue Request** shall be used to restart the transfer.

Any time **Stop At Block Gap Request** stops the data transfer, the Host Driver shall wait for **Transfer Complete** (in the *Normal Interrupt Status* register) before attempting to restart the transfer. When restarting the data transfer by **Continue Request**, the Host Driver shall clear **Stop At Block Gap Request** before or simultaneously.

**NOTE:** After setting **Stop at Block Gap Request** field, which should not be cleared unless Block Gap Event or Transfer Complete interrupt occurs. Otherwise, the module hangs.

### 5.14 WAKEUP CONTROL REGISTER

This register is mandatory for the Host Controller, but wakeup functionality depends on the Host Controller system hardware and software. The Host Driver shall maintain voltage on the SD Bus, by setting **SD Bus Power** to 1 in the *Power Control* register, when wakeup event via Card Interrupt is desired.

| Register | Address    | R/W | Description                         | Reset Value |
|----------|------------|-----|-------------------------------------|-------------|
| WAKCON0  | 0X4AC0002B | R/W | Wakeup Control Register (Channel 0) | 0x0         |
| WAKCON1  | 0X4A80002B | R/W | Wakeup Control Register (Channel 1) | 0x0         |

| Name      | Bit   | Description   | Initial Value |
|-----------|-------|---|---------------|
|           | [7:3] | Reserved  | 0             |
| ENWKUPREM | [2]   | <b>Wakeup Event Enable On SD Card Removal</b><br>This bit enables wakeup event via <b>Card Removal</b> assertion in the <i>Normal Interrupt Status</i> register. <b>FN_WUS</b> (Wake Up Support) in CIS does not affect this bit. (RW)<br>1 = Enable<br>0 = Disable                 | 0             |
| ENWKUPINS | [1]   | <b>Wakeup Event Enable On SD Card Insertion</b><br>This bit enables wakeup event via <b>Card Insertion</b> assertion in the <i>Normal Interrupt Status</i> register. <b>FN_WUS</b> (Wake Up Support) in CIS does not affect this bit. (RW)<br>1 = Enable<br>0 = Disable             | 0             |
| ENWKUPINT | [0]   | <b>Wakeup Event Enable On Card Interrupt</b><br>This bit enables wakeup event via <b>Card Interrupt</b> assertion in the <i>Normal Interrupt Status</i> register. This bit can be set to 1 if <b>FN_WUS</b> (Wake Up Support) in CIS is set to 1. (RW)<br>1 = Enable<br>0 = Disable | 0             |

## 5.15 CLOCK CONTROL REGISTER

At the initialization of the Host Controller, the Host Driver shall set the **SDCLK Frequency Select** according to the *Capabilities* register.

| Register | Address    | R/W | Description                  | Reset Value |
|----------|------------|-----|------------------------------|-------------|
| CLKCON0  | 0X4AC0002C | R/W | Command Register (Channel 0) | 0x0         |
| CLKCON1  | 0X4A80002C | R/W | Command Register (Channel 1) | 0x0         |

| Name    | Bit                       | Description  | Initial Value |                           |     |                           |     |                          |     |                          |     |                          |     |                         |     |                         |     |                         |     |                          |   |
|---------|---------------------------|--|---------------|---------------------------|-----|---------------------------|-----|--------------------------|-----|--------------------------|-----|--------------------------|-----|-------------------------|-----|-------------------------|-----|-------------------------|-----|--------------------------|---|
| SELFREQ | [15:8]                    | <p><b>SDCLK Frequency Select</b></p> <p>This register is used to select the frequency of <b>SDCLK</b> pin. The frequency is not programmed directly; rather this register holds the divisor of the <b>Base Clock Frequency For SD Clock</b> in the <i>Capabilities</i> register. Only the following settings are allowed.</p> <table border="1"> <tbody> <tr> <td>80h</td> <td>base clock divided by 256</td> </tr> <tr> <td>40h</td> <td>base clock divided by 128</td> </tr> <tr> <td>20h</td> <td>base clock divided by 64</td> </tr> <tr> <td>10h</td> <td>base clock divided by 32</td> </tr> <tr> <td>08h</td> <td>base clock divided by 16</td> </tr> <tr> <td>04h</td> <td>base clock divided by 8</td> </tr> <tr> <td>02h</td> <td>base clock divided by 4</td> </tr> <tr> <td>01h</td> <td>base clock divided by 2</td> </tr> <tr> <td>00h</td> <td>base clock (10MHz-63MHz)</td> </tr> </tbody> </table> <p>Setting 00h specifies the highest frequency of the SD Clock. When setting multiple bits, the most significant bit is used as the divisor. But multiple bits should not be set. The two default divider values can be calculated by the frequency that is defined by the <b>Base Clock Frequency For SD Clock</b> in the <i>Capabilities</i> register.</p> <p>(1) 25MHz divider value<br/>(2) 400kHz divider value</p> <p>According to the SD Physical Specification Version 1.01 and the SDIO Card Specification Version 1.0, maximum SD Clock frequency is 25MHz, and shall never exceed this limit.</p> <p>The frequency of SDCLK is set by the following formula:<br/>Clock Frequency = (Base Clock) / divisor</p> <p>Thus, choose the smallest possible divisor which results in a clock frequency that is less than or equal to the target frequency.</p> <p>For example, if the <b>Base Clock Frequency For SD Clock</b> in the <i>Capabilities</i> register has the value 33MHz, and the target frequency is 25MHz, then choosing the divisor value of 01h will yield 16.5MHz, which is the nearest frequency less than or equal to the target. Similarly, to approach a clock value of 400kHz, the divisor value of 40h yields the optimal clock value of 258kHz.</p> | 80h           | base clock divided by 256 | 40h | base clock divided by 128 | 20h | base clock divided by 64 | 10h | base clock divided by 32 | 08h | base clock divided by 16 | 04h | base clock divided by 8 | 02h | base clock divided by 4 | 01h | base clock divided by 2 | 00h | base clock (10MHz-63MHz) | 0 |
| 80h     | base clock divided by 256 |  |               |                           |     |                           |     |                          |     |                          |     |                          |     |                         |     |                         |     |                         |     |                          |   |
| 40h     | base clock divided by 128 |  |               |                           |     |                           |     |                          |     |                          |     |                          |     |                         |     |                         |     |                         |     |                          |   |
| 20h     | base clock divided by 64  |  |               |                           |     |                           |     |                          |     |                          |     |                          |     |                         |     |                         |     |                         |     |                          |   |
| 10h     | base clock divided by 32  |  |               |                           |     |                           |     |                          |     |                          |     |                          |     |                         |     |                         |     |                         |     |                          |   |

|         | [7:4]                     | <b>Reserved</b>  |               |                           |     |                           |     |                          |     |                          |     |                          |     |                         |     |                         |     |                         |     |                          |   |

| Name       | Bit | Description  | Initial Value |
|------------|-----|--|---------------|
| STBLEXTCLK | [3] | <p><b>External Clock Stable</b></p> <p>This bit is set to 1 when SD Clock output is stable after writing to <b>SD Clock Enable</b> in this register to 1. The SD Host Driver shall wait to issue command to start until this bit is set to 1. <b>(ROC)</b></p> <p>1 = Ready<br/>0 = Not Ready</p>  | 0             |
| ENSDCLK    | [2] | <p><b>SD Clock Enable</b></p> <p>The Host Controller shall stop <b>SDCLK</b> when writing this bit to 0. <b>SDCLK Frequency Select</b> can be changed when this bit is 0. Then, the Host Controller shall maintain the same clock frequency until <b>SDCLK</b> is stopped (Stop at <b>SDCLK=0</b>). If the <b>Card Inserted</b> in the <i>Present State register</i> is cleared, this bit shall be cleared. <b>(RW)</b></p> <p>1 = Enable<br/>0 = Disable</p>  | 0             |
| STBLINTCLK | [1] | <p><b>Internal Clock Stable</b></p> <p>This bit is set to 1 when SD Clock is stable after writing to <b>Internal Clock Enable</b> in this register to 1. The SD Host Driver shall wait to set <b>SD Clock Enable</b> until this bit is set to 1.</p> <p>Note: This is useful when using PLL for a clock oscillator that requires setup time. <b>(ROC)</b></p> <p>1 = Ready<br/>0 = Not Ready</p>   | 0             |
| ENINTCLK   | [0] | <p><b>Internal Clock Enable</b></p> <p>This bit is set to 0 when the Host Driver is not using the Host Controller or the Host Controller awaits a wakeup interrupt. The Host Controller should stop its internal clock to go very low power state. Still, registers shall be able to be read and written. Clock starts to oscillate when this bit is set to 1. When clock oscillation is stable, the Host Controller shall set <b>Internal Clock Stable</b> in this register to 1. This bit shall not affect card detection. <b>(RW)</b></p> <p>1 = Oscillate<br/>0 = Stop</p> |               |

### 5.16 TIMEOUT CONTROL REGISTER

At the initialization of the Host Controller, the Host Driver shall set the **Data Timeout Counter Value** according to the *Capabilities* register.

| Register     | Address    | R/W | Description                          | Reset Value |
|--------------|------------|-----|--------------------------------------|-------------|
| TIMEOUTCON 0 | 0X4AC0002E | R/W | Timeout Control Register (Channel 0) | 0x0         |
| TIMEOUTCON 1 | 0X4A80002E | R/W | Timeout Control Register (Channel 1) | 0x0         |

| Name       | Bit   | Description   | Initial Value |
|------------|-------|---|---------------|
|            | [7:4] | Reserved  | 0             |
| TIMEOUTCON | [3:0] | <p><b>Data Timeout Counter Value</b></p> <p>This value determines the interval by which DAT line timeouts are detected. Refer to the <b>Data Timeout Error</b> in the <i>Error Interrupt Status</i> register for information on factors that dictate timeout generation. Timeout clock frequency will be generated by dividing the base clock SDCLK value by this value. When setting this register, prevent inadvertent timeout events by clearing the <b>Data Timeout Error Status Enable</b> (in the <i>Error Interrupt Status Enable</i> register)</p> <p>1111b Reserved<br/>           1110b SDCLK x 2<sup>27</sup><br/>           1101b SDCLK x 2<sup>26</sup><br/>           .....<br/>           0001b SDCLK x 2<sup>14</sup><br/>           0000b SDCLK x 2<sup>13</sup></p> | 0             |

### 5.17 SOFTWARE RESET REGISTER

A reset pulse is generated when writing 1 to each bit of this register. After completing the reset, the Host Controller shall clear each bit. Because it takes some time to complete software reset, the SD Host Driver shall confirm that these bits are 0.

| Register | Address    | R/W | Description                         | Reset Value |
|----------|------------|-----|-------------------------------------|-------------|
| SWRST0   | 0X4AC0002F | R/W | Software Reset Register (Channel 0) | 0x0         |
| SWRST1   | 0X4A80002F | R/W | Software Reset Register (Channel 1) | 0x0         |

| Name   | Bit   | Description  | Initial Value |
|--------|-------|--|---------------|
|        | [7:3] | Reserved   | 0             |
| RSTDAT | [2]   | <p><b>Software Reset For DAT Line</b></p> <p>Only part of data circuit is reset. DMA circuit is also reset. (RWAC)</p> <p>The following registers and bits are cleared by this bit:</p> <p><i>Present State</i> register</p> <p><b>Buffer Read Enable</b></p> <p><b>Buffer Write Enable</b></p> <p><b>Read Transfer Active</b></p> <p><b>Write Transfer Active</b></p> <p><b>DAT Line Active</b></p> <p><b>Command Inhibit (DAT)</b></p> <p><i>Block Gap Control</i> register</p> <p><b>Continue Request</b></p> <p><b>Stop At Block Gap Request</b></p> <p><i>Normal Interrupt Status</i> register</p> <p><b>Buffer Read Ready</b></p> <p><b>Buffer Write Ready</b></p> <p><b>DMA Interrupt</b></p> <p><b>Block Gap Event</b></p> <p><b>Transfer Complete</b></p> <p>1 = Reset<br/>0 = Work</p> | 0             |
| RSTCMD | [1]   | <p><b>Software Reset For CMD Line</b></p> <p>Only part of command circuit is reset. (RWAC)</p> <p>The following registers and bits are cleared by this bit:</p> <p><i>Present State</i> register</p> <p><b>Command Inhibit (CMD)</b></p> <p><i>Normal Interrupt Status</i> register</p> <p><b>Command Complete</b></p> <p>1 = Reset<br/>0 = Work</p>   | 0             |

| Name   | Bit | Description   | Initial Value |
|--------|-----|---|---------------|
| RSTDAT | [0] | <p><b>Software Reset For All</b></p> <p>This reset affects the entire Host Controller except for the card detection circuit. Register bits of type ROC, RW, RW1C, RWAC are cleared to 0.</p> <p>During its initialization, the Host Driver shall set this bit to 1 to reset the Host Controller. The Host Controller shall reset this bit to 0 when capabilities registers are valid and the Host Driver can read them. Additional use of <b>Software Reset For All</b> may not affect the value of the <i>Capabilities</i> registers. If this bit is set to 1, the SD card shall reset itself and must be reinitialized by the Host Driver. (RWAC)</p> <p>1 = Reset<br/>0 = Work</p> | 0             |

### 5.18 NORMAL INTERRUPT STATUS REGISTER

The *Normal Interrupt Status Enable* affects reads of this register, but *Normal Interrupt Signal Enable* does not affect these reads. An interrupt is generated when the Normal Interrupt Signal Enable is enabled and at least one of the status bits is set to 1. For all bits except **Card Interrupt** and **Error Interrupt**, writing 1 to a bit clear it; writing to 0 keeps the bit unchanged. More than one status can be cleared with a single register write. The **Card Interrupt** is cleared when the card stops asserting the interrupt; that is, when the Card Driver services the interrupt condition.

| Register   | Address    | R/W      | Description                                  | Reset Value |
|------------|------------|----------|--|-------------|
| NORINTSTS0 | 0X4AC00030 | ROC/RW1C | Normal Interrupt Status Register (Channel 0) | 0x0         |
| NORINTSTS1 | 0X4A800030 | ROC/RW1C | Normal Interrupt Status Register (Channel 1) | 0x0         |

| Name       | Bit  | Description   | Initial Value |
|------------|------|---|---------------|
| STAERR     | [15] | <b>Error Interrupt</b><br>If any of the bits in the <i>Error Interrupt Status</i> register are set, then this bit is set. Therefore the Host Driver can efficiently test for an error by checking this bit first. This bit is read only. (ROC)<br>0 = No Error<br>1 = Error | 0             |
| STAFIA3    | [14] | FIFO SD Address Pointer Interrupt 3 Status (RW1C)<br>0 = Occurred<br>1 = Not Occurred   | 0             |
| STAFIA2    | [13] | FIFO SD Address Pointer Interrupt 2 Status (RW1C)<br>0 = Occurred<br>1 = Not Occurred   | 0             |
| STAFIA1    | [12] | FIFO SD Address Pointer Interrupt 1 Status (RW1C)<br>0 = Occurred<br>1 = Not Occurred   | 0             |
| STAFIA0    | [11] | FIFO SD Address Pointer Interrupt 0 Status (RW1C)<br>0 = Occurred<br>1 = Not Occurred   | 0             |
| STARWAIT   | [10] | Read Wait Interrupt Status (RW1C)<br>0 = Read Wait Interrupt Occurred<br>1 = Read Wait Interrupt Not Occurred<br><b>Note:</b> After checking response for the suspend command, release Read Wait interrupt status manually if BS = 0  | 0             |
| STACCS     | [9]  | CCS Interrupt Status (RW1C)<br>Command Complete Singal Interrupt Status bit is for CE-ATA interface mode.<br>0 = CCS Interrupt Occurred<br>1 = CCS Interrupt Not Occurred   | 0             |
| STACARDINT | [8]  | <b>Card Interrupt</b><br>Writing this bit to 1 does not clear this bit. It is cleared by resetting the SD card interrupt factor. In 1-bit mode, the Host Controller shall   | 0             |

| Name        | Bit | Description  | Initial Value |
|-------------|-----|--|---------------|
|             |     | <p>detect the <b>Card Interrupt</b> without SD Clock to support wakeup. In 4-bit mode, the card interrupt signal is sampled during the interrupt cycle, so there are some sample delays between the interrupt signal from the SD card and the interrupt to the Host System. It is necessary to define how to handle this delay.</p> <p>When this status has been set and the Host Driver needs to start this interrupt service, <b>Card Interrupt Status Enable</b> in the <i>Normal Interrupt Status Enable</i> register shall be set to 0 in order to clear the card interrupt statuses latched in the Host Controller and to stop driving the interrupt signal to the Host System. After completion of the card interrupt service (It should reset interrupt factors in the SD card and the interrupt signal may not be asserted), set <b>Card Interrupt Status Enable</b> to 1 and start sampling the interrupt signal again. (ROC, RW1C)</p> <p>1 = Generate Card Interrupt<br/>0 = No Card Interrupt</p> |               |
| STACARDREM  | [7] | <p><b>Card Removal</b></p> <p>This status is set if the <b>Card Inserted</b> in the <i>Present State</i> register changes from 1 to 0. When the Host Driver writes this bit to 1 to clear this status, the status of the Card Inserted in the Present State register should be confirmed. Because the card detect state may possibly be changed when the Host Driver clear this bit and interrupt event may not be generated. (RW1C)</p> <p>1 = Card removed<br/>0 = Card state stable or Debouncing</p>   | 0             |
| STACARDINS  | [6] | <p><b>Card Insertion</b></p> <p>This status is set if the <b>Card Inserted</b> in the <i>Present State</i> register changes from 0 to 1. When the Host Driver writes this bit to 1 to clear this status, the status of the Card Inserted in the Present State register should be confirmed. Because the card detect state may possibly be changed when the Host Driver clear this bit and interrupt event may not be generated. (RW1C)</p> <p>1 = Card inserted<br/>0 = Card state stable or Debouncing</p>  | 0             |
| STABUFRDRDY | [5] | <p><b>Buffer Read Ready</b></p> <p>This status is set if the <b>Buffer Read Enable</b> changes from 0 to 1. Refer to the <b>Buffer Read Enable</b> in the <i>Present State</i> register. (RW1C)</p> <p>1 = Ready to read buffer<br/>0 = Not ready to read buffer</p>   | 0             |
| STABUFWTRDY | [4] | <p><b>Buffer Write Ready</b></p> <p>This status is set if the <b>Buffer Write Enable</b> changes from 0 to 1. Refer to the <b>Buffer Write Enable</b> in the <i>Present State</i> register. (RW1C)</p> <p>1 = Ready to write buffer<br/>0 = Not ready to write buffer</p>  | 0             |

| Name        | Bit | Description  | Initial Value |
|-------------|-----|--|---------------|
| STADMAINT   | [3] | <p><b>DMA Interrupt</b></p> <p>This status is set if the Host Controller detects the Host DMA Buffer boundary during transfer. Refer to the <b>Host DMA Buffer Boundary</b> in the <i>Block Size</i> register. Other DMA interrupt factors may be added in the future. This interrupt shall not be generated after the <b>Transfer Complete</b>. (RW1C)</p> <p>1 = <b>DMA Interrupt</b> is generated<br/>0 = No <b>DMA Interrupt</b></p>   | 0             |
| STABLK GAP  | [2] | <p><b>Block Gap Event</b></p> <p>If the <b>Stop At Block Gap Request</b> in the <i>Block Gap Control</i> register is set, this bit is set when both a read / write transaction is stopped at a block gap. If <b>Stop At Block Gap Request</b> is not set to 1, this bit is not set to 1.</p> <p>(1) In the case of a Read Transaction</p> <p>This bit is set at the falling edge of the <b>DAT Line Active Status</b> (When the transaction is stopped at SD Bus timing. The Read Wait must be supported in order to use this function.</p> <p>(2) Case of Write Transaction</p> <p>This bit is set at the falling edge of <b>Write Transfer Active Status</b> (After getting CRC status at SD Bus timing).</p> <p>1 = Transaction stopped at block gap<br/>0 = No <b>Block Gap Event</b></p>  | 0             |
| STATRANCPLT | [1] | <p><b>Transfer Complete</b></p> <p>This bit is set when a read / write transfer is completed.</p> <p>(1) In the case of a Read Transaction</p> <p>This bit is set at the falling edge of <b>Read Transfer Active Status</b>. There are two cases in which this interrupt is generated. The first is when a data transfer is completed as specified by data length (After the last data has been read to the Host System). The second is when data has stopped at the block gap and completed the data transfer by setting the <b>Stop At Block Gap Request</b> in the <i>Block Gap Control</i> register (After valid data has been read to the Host System).</p> <p>(2) In the case of a Write Transaction</p> <p>This bit is set at the falling edge of the <b>DAT Line Active Status</b>. There are two cases in which this interrupt is generated. The first is when the last data is written to the SD card as specified by data length and the busy signal released. The second is when data transfers are stopped at the block gap by setting <b>Stop At Block Gap Request</b> in the <i>Block Gap Control</i> register and data transfers completed. (After valid data is written to the SD card and the busy signal released). (RW1C)</p> <p>The table below shows that <b>Transfer Complete</b> has higher priority</p> | 0             |

| Name              | Bit                   | Description  | Initial Value     |                       |                       |   |   |                               |            |   |   |   |            |                        |   |

| Don't care        | 1                     | Response not received within 64 SDCLK cycles.  |                   |                       |                       |   |   |                               |            |   |   |   |            |                        |   |
| 1                 | 0                     | Response received  |                   |                       |                       |   |   |                               |            |   |   |   |            |                        |   |

**NOTES:**

- Host Driver may check if interrupt is actually cleared by polling or monitoring the INTREQ port. If HCLK is much faster than SDCLK, it takes long time to be cleared for the bits actually.
- Card Interrupt status bit keeps previous value until next card interrupt period (level interrupt) and can be cleared when write to 1 (RW1C).

### 5.19 ERROR INTERRUPT STATUS REGISTER

Signals defined in this register can be enabled by the *Error Interrupt Status Enable* register, but not by the *Error Interrupt Signal Enable* register. The interrupt is generated when the *Error Interrupt Signal Enable* is enabled and at least one of the statuses is set to 1. Writing to 1 clears the bit and writing to 0 keeps the bit unchanged. More than one status can be cleared at the one register write.

| Register   | Address    | R/W      | Description                                 | Reset Value |
|------------|------------|----------|---|-------------|
| ERRINTSTS0 | 0X4AC00032 | ROC/RW1C | Error Interrupt Status Register (Channel 0) | 0x0         |
| ERRINTSTS1 | 0X4A800032 | ROC/RW1C | Error Interrupt Status Register (Channel 1) | 0x0         |

| Name          | Bit     | Description   | Initial Value |
|---------------|---------|---|---------------|
|               | [15:10] | <b>Reserved</b>   | 0             |
| ADMAERR       | [9]     | <p><b>ADMA Error</b></p> <p>This bit is set when the Host Controller detects errors during ADMA based data transfer. The state of the ADMA at an error occurrence is saved in the <i>ADMA Error Status Register</i>. In addition, the Host Controller generates this Interrupt when it detects invalid descriptor data (Valid=0) at the ST_FDS state. <b>ADMA Error State</b> in the <i>ADMA Error Status</i> indicates that an error occurs in ST_FDS state. The Host Driver may find that Valid bit is not set at the error descriptor.</p> <p>1 = Error<br/>0 = No Error</p> | 0             |
| STAACMDERR    | [8]     | <p><b>Auto CMD12 Error</b></p> <p>Occurs when detecting that one of the bits in <i>Auto CMD12 Error Status</i> register has changed from 0 to 1. This bit is set to 1, not only when the errors in Auto CMD12 occur but also when Auto CMD12 is not executed due to the previous command error.</p> <p>1 = Error<br/>0 = No Error</p>   | 0             |
| STACURERR     | [7]     | <p><b>Current Limit Error</b></p> <p>Not implemented in this version. Always 0.</p>   | 0             |
| STADENDERR    | [6]     | <p><b>Data End Bit Error</b></p> <p>Occurs either when detecting 0 at the end bit position of read data which uses the <i>DAT</i> line or at the end bit position of the CRC Status.</p> <p>1 = Error<br/>0 = No Error</p>  | 0             |
| STADATCRCERR  | [5]     | <p><b>Data CRC Error</b></p> <p>Occurs when detecting CRC error when transferring read data which uses the <i>DAT</i> line or when detecting the Write CRC status having a value of other than "010".</p> <p>1 = Error<br/>0 = No Error</p>   | 0             |
| STADATTOUTERR | [4]     | <p><b>Data Timeout Error</b></p>  | 0             |

| Name          | Bit | Description   | Initial Value |
|---------------|-----|---|---------------|
|               |     | Occurs when detecting one of following timeout conditions.<br>(1) Busy timeout for R1b,R5b type<br>(2) Busy timeout after Write CRC status<br>(3) Write CRC Status timeout<br>(4) Read Data timeout.<br>1 = Timeout<br>0 = No Error   |               |
| STACMDIDXERR  | [3] | <b>Command Index Error</b><br>Occurs if a Command Index error occurs in the command response.<br>1 = Error<br>0 = No Error  | 0             |
| CMDEBITERR    | [2] | <b>Command End Bit Error</b><br>Occurs when detecting that the end bit of a command response is 0.<br>1 = End bit Error generated<br>0 = No Error   |               |
| STACMDCRCERR  | [1] | <b>Command CRC Error</b><br>Command CRC Error is generated in two cases.<br>(1) If a response is returned and the <b>Command Timeout Error</b> is set to 0 (indicating no timeout), this bit is set to 1 when detecting a CRC error in the command response.<br>(2) The Host Controller detects a <b>CMD</b> line conflict by monitoring the <b>CMD</b> line when a command is issued. If the Host Controller drives the <b>CMD</b> line to 1 level, but detects 0 level on the <b>CMD</b> line at the next SDCLK edge, then the Host Controller shall abort the command (Stop driving <b>CMD</b> line) and set this bit to 1. The Command Timeout Error shall also be set to 1 to distinguish <b>CMD</b> line conflict.<br>1 = CRC Error generated<br>0 = No Error | 0             |
| STACMDTOUTERR | [0] | <b>Command Timeout Error</b><br>Occurs only if no response is returned within 64 <b>SDCLK</b> cycles from the end bit of the command. If the Host Controller detects a <b>CMD</b> line conflict, in which case <b>Command CRC Error shall</b> also be set as shown in Table 33, this bit <b>shall</b> be set without waiting for 64 <b>SDCLK</b> cycles because the command will be aborted by the Host Controller.<br>1 = Timeout<br>0 = No Error  | 0             |

The relation between **Command CRC Error** and **Command Timeout Error** is shown in Table below.

**Table 21-4. The relation between Command CRC Error and Command Timeout Error**

| <b>Command CRC Error</b> | <b>Command Timeout Error</b> | <b>Kinds of error</b>    |
|--------------------------|------------------------------|--------------------------|
| 0                        | 0                            | No Error                 |
| 0                        | 1                            | Response Timeout Error   |
| 1                        | 0                            | Response CRC Error       |
| 1                        | 1                            | <i>CMD</i> line conflict |

## 5.20 NORMAL INTERRUPT STATUS ENABLE REGISTER

Setting to 1 enables Interrupt Status.

| STANCMDAER    | [7]    | <b>Command Not Issued By Auto CMD12 Error</b><br>Setting this bit to 1 means CMD_wo_DAT is not executed due to an Auto CMD12 Error (D04-D01) in this register.<br>1 = Not Issued<br>0 = No error  | 0             |
|               | [6:5]  | <b>Reserved</b>   | 0             |
| STACMDIDXERR  | [4]    | <b>Auto CMD12 Index Error</b><br>Occurs if the Command Index error occurs in response to a command.<br>1 = Error<br>0 = No Error  | 0             |
| STACMDEBITAER | [3]    | <b>Auto CMD12 End Bit Error</b><br>Occurs when detecting that the end bit of command response is 0.<br>1 = End Bit Error Generated<br>0 = No Error  | 0             |
| STACMDCRCAER  | [2]    | <b>Auto CMD12 CRC Error</b><br>Occurs when detecting a CRC error in the command response.<br>1 = CRC Error Generated<br>0 = No Error  | 0             |
| STACMDTOUTAER | [1]    | <b>Auto CMD12 Timeout Error</b><br>Occurs if no response is returned within 64 <b>SDCLK</b> cycles from the end bit of command. If this bit is set to 1, the other error status bits (D04-D02) are meaningless.<br>1 = Time out<br>0 = No Error   | 0             |
| STANACMDAER   | [0]    | <b>Auto CMD12 Not Executed</b><br>If memory multiple block data transfer is not started due to command error, this bit is not set because it is not necessary to issue Auto CMD12. Setting this bit to 1 means the Host Controller cannot issue Auto CMD12 to stop memory multiple block data transfer due to some error. If this bit is set to 1, other error status bits (D04-D01) are meaningless.<br>1 = Not executed<br>0 = Executed | 0             |

The relation between Auto CMD12 CRC Error and Auto CMD12 Timeout Error is shown below.

**Table 21-5. The Relation Between Command CRC Error and Command Timeout Error**

| Auto CMD12 CRC Error | Auto CMD12 Timeout Error | Kinds of error           |
|----------------------|--------------------------|--------------------------|
| 0                    | 0                        | No Error                 |
| 0                    | 1                        | Response Timeout Error   |
| 1                    | 0                        | Response CRC Error       |
| 1                    | 1                        | <i>CMD line conflict</i> |

The timing of changing *Auto CMD12 Error Status* can be classified in three scenarios:

- (1) When the Host Controller is going to issue Auto CMD12  
Set D00 to 1 if Auto CMD12 cannot be issued due to an error in the previous command.  
Set D00 to 0 if Auto CMD12 is issued.
- (2) At the end bit of an Auto CMD12 response  
Check received responses by checking the error bits D01, D02, D03 and D04.  
Set to 1 if error is detected.  
Set to 0 if error is not detected.
- (3) Before reading the Auto CMD12 Error Status bit D07  
Set D07 to 1 if there is a command cannot be issued  
Set D07 to 0 if there is no command to issue

Timing of generating the **Auto CMD12 Error** and writing to the *Command* register are asynchronous. Then D07 shall be sampled when driver never writing to the *Command* register. So just before reading the *Auto CMD12 Error Status* register is good timing to set the D07 status bit. An Auto CMD12 Error Interrupt is generated when one of the error bits D00 to D04 is set to 1. The **Command Not Issued By Auto CMD12 Error** does not generate an interrupt.

## 5.25 CAPABILITIES REGISTER

This register provides the Host Driver with information specific to the Host Controller implementation. The Host Controller may implement these values as fixed or loaded from flash memory during power on initialization. Refer to **Software Reset for All** in the *Software Reset* register for loading from flash memory and completion timing control.

| Register | Address    | R/W    | Description                       | Reset Value |
|----------|------------|--------|-----------------------------------|-------------|
| CAPAREG0 | 0X4AC00040 | HWInit | Capabilities Register (Channel 0) | 0x05E80080  |
| CAPAREG1 | 0X4A800040 | HWInit | Capabilities Register (Channel 1) | 0x05E80080  |

| Name       | Bit     | Description   | Initial Value |
|------------|---------|---|---------------|
|            | [31:27] | Reserved  |               |
| CAPAV18    | [26]    | <b>Voltage Support 1.8V</b> (HWInit)<br>1 = 1.8V Supported<br>0 = 1.8V Not Supported  | 1             |
| CAPAV30    | [25]    | <b>Voltage Support 3.0V</b> (HWInit)<br>1 = 3.0V Supported<br>0 = 3.0V Not Supported  | 0             |
| CAPAV33    | [24]    | <b>Voltage Support 3.3V</b> (HWInit)<br>1 = 3.3V Supported<br>0 = 3.3V Not Supported  | 1             |
| CAPASUSRES | [23]    | <b>Suspend/Resume Support</b> (HWInit)<br>This bit indicates whether the Host Controller supports Suspend / Resume functionality. If this bit is 0, the Suspend and Resume mechanism are not supported and the Host Driver shall not issue either Suspend or Resume commands.<br>1 = Supported<br>0 = Not Supported | 1             |
| CAPADMA    | [22]    | <b>DMA Support</b> (HWInit)<br>This bit indicates whether the Host Controller is capable of using DMA to transfer data between system memory and the Host Controller directly.<br>1 = DMA Supported<br>0 = DMA Not Supported  | 1             |
| CAPAHSPD   | [21]    | <b>High Speed Support</b> (HWInit)<br>This bit indicates whether the Host Controller and the Host System support High Speed mode and they can supply SD Clock frequency from 25MHz to 50MHz.<br>1 = High Speed Supported<br>0 = High Speed Not Supported  | 1             |
|            | [20:18] | <b>Reserved</b>   |               |

| Name          | Bit     | Description   | Initial Value |
|---------------|---------|---|---------------|
| CAPAMAXBLKLEN | [17:16] | <p><b>Max Block Length</b> (HWInit)</p> <p>This value indicates the maximum block size that the Host Driver can read and write to the buffer in the Host Controller. The buffer shall transfer this block size without wait cycles. Three sizes can be defined as indicated below.</p> <p>00 = 512-byte<br/>01 = 1024-byte<br/>10 = 2048-byte<br/>11 = Reserved</p>   | 0             |
|               | [15:14] | <b>Reserved</b>   | 0             |
| CAPABASECLK   | [13:8]  | <p><b>Base Clock Frequency For SD Clock</b> (HWInit)</p> <p>This value indicates the base (maximum) clock frequency for the SD Clock. Unit values are 1MHz. If the real frequency is 16.5MHz, the larger value shall be set 01 0001b (17MHz) because the Host Driver use this value to calculate the clock divider value (Refer to the <b>SDCLK Frequency Select</b> in the <i>Clock Control</i> register.) and it shall not exceed upper limit of the SD Clock frequency. The supported clock range is 10MHz to 63MHz. If these bits are all 0, the Host System has to get information via another method.</p> <p>Not 0 = 1MHz to 63MHz<br/>000000b = Get information via another method</p> | 0             |
| CAPATOUTUNIT  | [7]     | <p><b>Timeout Clock Unit</b> (HWInit)</p> <p>This bit shows the unit of base clock frequency used to detect <b>Data Timeout Error</b>.</p> <p>0 = kHz<br/>1 = MHz</p>   | 1             |
|               | [6]     | <b>Reserved</b>   | 0             |
| CAPATOUTCLK   | [5:0]   | <p><b>Timeout Clock Frequency</b> (HWInit)</p> <p>This bit shows the base clock frequency used to detect <b>Data Timeout Error</b>. The <b>Timeout Clock Unit</b> defines the unit of this field value.</p> <p><b>Timeout Clock Unit</b> =0 [kHz] unit: 1kHz to 63kHz<br/><b>Timeout Clock Unit</b> =1 [MHz] unit: 1MHz to 63MHz</p> <p>Not 0 = 1kHz to 63kHz or 1MHz to 63MHz<br/>00 0000b = Get information via another method</p>  | 0             |

## 5.26 MAXIMUM CURRENT CAPABILITIES REGISTER

These registers indicate maximum current capability for each voltage. The value is meaningful if **Voltage Support** is set in the *Capabilities* register. If this information is supplied by the Host System via another method, all *Maximum Current Capabilities* register shall be 0.

| Register | Address    | R/W    | Description                                       | Reset Value |
|----------|------------|--------|---|-------------|
| MAXCURR0 | 0X4AC00048 | HWInit | Maximum Current Capabilities Register (Channel 0) | 0x0         |
| MAXCURR1 | 0X4A800048 | HWInit | Maximum Current Capabilities Register (Channel 1) | 0x0         |

| Name      | Bit     | Description                              | Initial Value |
|-----------|---------|--|---------------|
|           | [31:24] | Reserved                                 |               |
| MAXCURR18 | [23:16] | <b>Maximum Current for 1.8V</b> (HWInit) | 0             |
| MAXCURR30 | [15:8]  | <b>Maximum Current for 3.0V</b> (HWInit) | 0             |
| MAXCURR33 | [7:0]   | <b>Maximum Current for 3.3V</b> (HWInit) | 0             |

This register measures current in 4mA steps. Each voltage level's current support is described using the Table below.

**Table 21-6. Maximum Current Value Definition**

| Register Value | Current Value                      |
|----------------|------------------------------------|
| 0              | Get information via another method |
| 1              | 4mA                                |
| 2              | 8mA                                |
| 3              | 12mA                               |
| ...            | ...                                |
| 255            | 1020mA                             |

## 5.27 CONTROL REGISTER 2

| Register   | Address    | R/W | Description                    | Reset Value |
|------------|------------|-----|--------------------------------|-------------|
| CONTROL2_0 | 0X4AC00080 | R/W | Control register 2 (Channel 0) | 0x0         |
| CONTROL2_1 | 0X4A800080 | R/W | Control register 2 (Channel 1) | 0x0         |

| Name       | Bit     | Description   | Initial Value |
|------------|---------|---|---------------|
|            | [31]    | <b>Write Status Clear Async Mode Enable</b><br>This bit can make async-clear enable about Normal and Error interrupt status bit. During the initialization procedure command operation, this bit should be enabled.<br>0 = Disable<br>1 = Enable                                      | 0             |
| CDINVRXD3  | [30]    | <b>Command Conflict Mask Enable</b><br>This bit can mask enable the Command Conflict Status (bit [1:0] of the "ERROR INTERRUPT STATUS REGISTER")<br>0 = Mask Disable<br>1 = Mask Enable   | 0             |

| ENFBCLKRX  | [14]    | <b>Feedback Clock Enable for Rx Data/Command Clock</b><br>0 = Disable<br>1 = Enable   | 0             |
| SDCDSEL    | [13]    | <b>SD Card Detect Signal Selection</b>  | 0             |

| Name             | Bit    | Description   | Initial Value |
|------------------|--------|---|---------------|
|                  |        | Card Detect Pin Level does not simply reflect SDCD# pin, but chooses from SDCD, DAT[3], or CDTestIvl depending on CDSigSel and this field (SDCDSel) values<br>0 = nSDCD is used for SD Card Detect Signal<br>1 = DAT[3] is used for SD Card Detect Signal                             |               |
| CDSYNCSSEL       | [12]   | <b>SD Card Detect Sync Support</b><br>This field is used to enable output CMD and DAT referencing SD Bus Power bit in the "PWRCON register", when being set.<br>0 = No Sync, no switch output enable signal (Command, Data)<br>1 = Sync, control output enable signal (Command, Data) | 0             |
| ENBUSYCHKTXSTART | [11]   | <b>CE-ATA I/F mode</b><br>Busy state check before Tx Data start state<br>0 = Disable<br>1 = Enable  | 0             |
| DFCNT            | [10:9] | <b>Debounce Filter Count</b><br>Debounce Filter Count setting register for Card Detect signal input (SDCD#)<br>00 = No use debounce filter<br>01 = 4 iSDCLK<br>10 = 16 iSDCLK<br>11 = 64 iSDCLK   | 0             |
| ENCLKOUTHOLD     | [8]    | <b>SDCLK Hold Enable</b><br>The enter and exit of the SDCLK Hold state is done by Host Controller.<br>0 = Disable<br>1 = Enable   | 0             |
| RWAITMODE        | [7]    | <b>Read Wait Release Control</b><br>0 = Read Wait state is released by the Host Controller (Auto)<br>1 = Read Wait state is released by the Host Device (Manual)  | 0             |
| DISBUFRD         | [6]    | <b>Buffer Read Disable</b><br>0 = Normal mode, user can read buffer(FIFO) data using 0x20 register<br>1 = User cannot read buffer (FIFO) data using 0x20 register. In this case, the buffer memory only can be read through memory area. (Debug purpose)                              | 0             |
| SELBASECLK       | [5:4]  | <b>Base Clock Source Select</b><br>00 or 01 = HCLK<br>10 = SCLK_HSMMC# : EPLLout, MPLLout, PLL_source_clk or CLK27 clock (from SYSCON block, can be selected by MMC#_SEL[1:0] fields of the CLK_SRC register in SYSCON block)<br>11 = External Clock source (XTI or XEXTCLK)          | 00            |

| Name           | Bit | Description  | Initial Value |
|----------------|-----|--|---------------|
| PWRSYNC        | [3] | <b>SD OP Power Sync Support with SD Card</b><br>This field is used to enable input CMD and DAT referencing SD Bus Power bit in the "PWRCON register", when being set.<br>0 = No Sync, no switch input enable signal (Command, Data)<br>1 = Sync, control input enable signal (Command, Data) | 0             |
|                | [2] | <b>Reserved</b>  | 0             |
| ENCLKOUTMSKCON | [1] | <b>SDCLK output clock masking when Card Insert cleared</b><br>This field when High is used not to stop SDCLK when No Card state.<br>0 = Disable<br>1 = Enable  | 0             |
| HWINITFIN      | [0] | <b>SD Host Controller Hardware Initialization Finish</b><br>0 = Not Finish<br>1 = Finish   | 0             |

**NOTES:**

1. Ensure to always set SDCLK Hold Enable (EnSCHold) if the card does not support Read Wait to guarantee for Receive data not overwritten to the internal FIFO memory.
2. CMD\_wo\_DAT issue is prohibited during READ transfer when SDCLK Hold Enable is set

## 5.28 CONTROL REGISTER 3

| Register   | Address    | R/W | Description  | Reset Value |
|------------|------------|-----|--|-------------|
| CONTROL3_0 | 0X4AC00084 | R/W | FIFO Interrupt Control (Control Register 3)<br>(Channel 0) | 0x7F5F3F1F  |
| CONTROL3_1 | 0X4A800084 | R/W | FIFO Interrupt Control (Control Register 3)<br>(Channel 1) | 0x7F5F3F1F  |

| Name   | Bit     | Description  | Initial Value |
|--------|---------|--|---------------|
| FCSEL3 | [31]    | <b>Feedback Clock Select [3]</b><br>Reference (note 1)   | 0x0           |
| FIA3   | [30:24] | <b>FIFO Interrupt Address register 3</b><br>FIFO (512Byte Buffer memory, word address unit)<br>Initial value (0x7F) generates at 512-byte (128-word) position. | 0x7F          |
| FCSEL2 | [23]    | <b>Feedback Clock Select [2]</b><br>Reference (note 1)   | 0x0           |
| FIA2   | [22:16] | <b>FIFO Interrupt Address register 2</b><br>FIFO (512Byte Buffer memory, word address unit)<br>Initial value (0x5F) generates at 384-byte (96-word) position.  | 0x5F          |
| FCSEL1 | [15]    | <b>Feedback Clock Select [1]</b><br>Reference (note 2)   | 0x0           |
| FIA1   | [14:8]  | <b>FIFO Interrupt Address register 1</b><br>FIFO (512Byte Buffer memory, word address unit)<br>Initial value (0x3F) generates at 256-byte (64-word) position.  | 0x3F          |
| FCSELO | [7]     | <b>Feedback Clock Select [0]</b><br>Reference (note 2)   | 0x0           |
| FIA0   | [6:0]   | <b>FIFO Interrupt Address register 0</b><br>FIFO (512Byte Buffer memory, word address unit)<br>Initial value (0x1F) generates at 128-byte (32-word) position.  | 0x1F          |

**NOTES:**

- FCSel[3:2] : Tx Feedback Clock Delay Control : Inverter delay means 10ns delay when SDCLK 50MHz setting  
01 = Delay1 (basic delay), 11 = Delay2 (basic delay + 2ns),  
00 = Delay3 (inverter delay), 10 = Delay4 (inverter delay + 2ns)
- FCSel[1:0] : Rx Feedback Clock Delay Control : Inverter delay means 10ns delay when SDCLK 50MHz setting  
01 = Delay1 (basic delay), 11 = Delay2 (basic delay + 2ns),  
00 = Delay3 (inverter delay), 10 = Delay4 (inverter delay + 2ns)
- Tx Feedback inversion setting (FCSel[3:2] = 00 or 10), Tx Feedback clock enable (ENFBCLKTX=0) and Normal Speed mode (ENHIGHSPD = 0) setting make Tx data transfer mismatch (Do not set).

## 5.29 DEBUG REGISTER

| Register | Address    | R/W | Description                | Reset Value |
|----------|------------|-----|----------------------------|-------------|
| DEBUG_0  | 0X4AC00088 | R/W | DEBUG register (Channel 0) | Not fixed   |
| DEBUG_1  | 0X4A800088 | R/W | DEBUG register (Channel 1) | Not fixed   |

| Name   | Bit    | Description  | Initial Value |
|--------|--------|--|---------------|
| DBGREG | [31:0] | <b>Debug Register</b><br>Read Only Register for Debug Purpose (RO) | Not fixed     |

## 5.30 CONTROL REGISTER 4

| Register   | Address    | R/W | Description                    | Reset Value |
|------------|------------|-----|--------------------------------|-------------|
| CONTROL4_0 | 0x4AC0008C | R/W | Control register 4 (Channel 0) | 0x0         |
| CONTROL4_1 | 0x4A80008C | R/W | Control register 4 (Channel 1) | 0x0         |

| Name     | Bit    | Description  | Initial Value |
|----------|--------|--|---------------|
| Reserved | [31:1] | –  | 0             |
| StaBusy  | [0]    | <b>Status Busy</b><br>This bit is “High” when the clock domain crossing (HCLK to SDCLK) operation is processing. This bit is status bit and Read Only (RO) | 0             |

## 5.31 FORCE EVENT REGISTER FOR AUTO CMD12 ERROR STATUS

| Register | Address    | R/W | Description   | Reset Value |
|----------|------------|-----|---|-------------|
| FEAER0   | 0X4AC00050 | WO  | Force Event Auto CMD12 Error Interrupt Register Error Interrupt (Channel 0) | 0x0000      |
| FEAER1   | 0X4A800050 | WO  | Force Event Auto CMD12 Error Interrupt Register Error Interrupt (Channel 1) | 0x0000      |

The Force Event Register is not a physically implemented register. Rather, it is an address at which the Auto CMD12 Error Status Register can be written.

- Writing 1: set each bit of the Auto CMD12 Error Status Register
- Writing 0: no effect

D15 D12

| Name | Bit    | Description   | Initial Value |
|------|--------|---|---------------|
|      | [15:8] | –   | 0x0           |
|      | [7]    | <b>Force Event for Command Not Issued By Auto CMD12 Error</b><br>1 = Interrupt is generated<br>0 = No Interrupt | 0             |
|      | [6:5]  | –   | 0             |
|      | [4]    | <b>Force Event for Auto CMD12 Index Error</b><br>1 = Interrupt is generated<br>0 = No Interrupt                 | 0             |
|      | [3]    | <b>Force Event for Auto CMD12 End Bit Error</b><br>1 = Interrupt is generated<br>0 = No Interrupt               | 0             |
|      | [2]    | <b>Force Event for Auto CMD12 CRC Error</b><br>1 = Interrupt is generated<br>0 = No Interrupt                   | 0             |
|      | [1]    | <b>Force Event for Auto CMD12 Timeout Error</b><br>1 = Interrupt is generated<br>0 = No Interrupt               | 0             |
|      | [0]    | <b>Force Event for Auto CMD12 Not Executed</b><br>1 = Interrupt is generated<br>0 = No Interrupt                | 0             |

## 5.32 FORCE EVENT REGISTER FOR ERROR INTERRUPT STATUS

| Register | Address    | R/W | Description  | Reset Value |
|----------|------------|-----|--|-------------|
| FEERR0   | 0X4AC00052 | WO  | Force Event Error Interrupt Register Error Interrupt (Channel 0) | 0x0000      |
| FEERR1   | 0X4A800052 | WO  | Force Event Error Interrupt Register Error Interrupt (Channel 1) | 0x0000      |

The *Force Event* Register is not a physically implemented register. Rather, it is an address at which the *Error Interrupt Status* register can be written. The effect of a write to this address will be reflected in the *Error Interrupt Status* Register if the corresponding bit of the *Error Interrupt Status Enable* Register is set.

- Writing 1: set each bit of the Error Interrupt Status Register
- Writing 0: no effect

**Note:** By setting this register, the Error Interrupt can be set in the *Error Interrupt Status* register. In order to generate interrupt signal, both the *Error Interrupt Status Enable* and **Error Interrupt Signal Enable** shall be set.

| Name | Bit     | Description  | Initial Value |
|------|---------|--|---------------|
|      | [15:10] | Reserved   | 0x0           |
|      | [9]     | <b>Force Event for ADMA Error</b><br>1 = Interrupt is generated<br>0 = No Interrupt            | 0             |
|      | [8]     | <b>Force Event for Auto CMD12 Error</b><br>1 = Interrupt is generated<br>0 = No Interrupt      | 0             |
|      | [7]     | Reserved   | 0             |
|      | [6]     | <b>Force Event for Data End Bit Error</b><br>1 = Interrupt is generated<br>0 = No Interrupt    | 0             |
|      | [5]     | <b>Force Event for Data CRC Error</b><br>1 = Interrupt is generated<br>0 = No Interrupt        | 0             |
|      | [4]     | <b>Force Event for Data Timeout Error</b><br>1 = Interrupt is generated<br>0 = No Interrupt    | 0             |
|      | [3]     | <b>Force Event for Command Index Error</b><br>1 = Interrupt is generated<br>0 = No Interrupt   | 0             |
|      | [2]     | <b>Force Event for Command End Bit Error</b><br>1 = Interrupt is generated<br>0 = No Interrupt | 0             |
|      | [1]     | <b>Force Event for Command CRC Error</b><br>1 = Interrupt is generated<br>0 = No Interrupt     | 0             |
|      | [0]     | <b>Force Event for Command Timeout Error</b><br>1 = Interrupt is generated<br>0 = No Interrupt | 0             |

### 5.33 ADMA ERROR STATUS REGISTER

When **ADMA Error** Interrupt is occurred, the **ADMA Error States** field in this register holds the ADMA state and the *ADMA System Address* Register holds the address around the error descriptor. For recovering the error, the Host Driver requires the ADMA state to identify the error descriptor address as follows:

- ST\_STOP: Previous location set in the ADMA System Address register is the error descriptor address
- ST\_FDS: Current location set in the ADMA System Address register is the error descriptor address
- ST\_CADR: This state is never set because do not generate ADMA error in this state.
- ST\_TFR: Previous location set in the ADMA System Address register is the error descriptor address

In case of write operation, the Host Driver should use ACMD22 to get the number of written block rather than using this information, since unwritten data may exist in the Host Controller.

The Host Controller generates the **ADMA Error** Interrupt when it detects invalid descriptor data (Valid=0) at the ST\_FDS state. In this case, ADMA Error State indicates that an error occurs at ST\_FDS state. The Host Driver may find that the Valid bit is not set in the error descriptor.

| Register | Address    | R/W | Description                            | Reset Value |
|----------|------------|-----|--|-------------|
| ADMAERR0 | 0X4AC00054 | R/W | ADMA Error Status Register (Channel 0) | 0x00        |
| ADMAERR1 | 0X4A800054 | R/W | ADMA Error Status Register (Channel 1) | 0x00        |

| Name | Bit     | Description   | Initial Value |
|------|---------|---|---------------|

# 22 LCD CONTROLLER

## 1 OVERVIEW

The LCD controller consists of logic for transferring image data from a video buffer located in system memory to an external LCD driver interface. LCD driver interface has two kind of interface. One is conventional RGB-interface and the other is i80-System interface. The LCD controller supports up to two overlay image windows, which support various color format, 16 level alpha blending, color key, x-y position control, soft scrolling, variable window size, and etc.

The LCD controller can support the various requirements on the screen related to the number of horizontal and vertical pixels, data line width for the data interface, interface timing, and refresh rate.

The LCD controller transfers the video data from the frame buffer and generates the necessary control signals such as, RGB\_VSYNC, RGB\_HSYNC, RGB\_VCLK, RGB\_VDEN, and SYS\_CS0.... As well as the control signals, LCD controller has the data ports for video data, which are RGB\_VD[23:0] and SYS\_VD[17:0] as shown in Figure 22-1.

Figure 22-1. LCD Controller Block diagram

## 1.1 FEATURES

### 1.1.1 The features of LCD controller are:

- Bus Interface 32-bit AMBA AHB Master /AHB Slave
- Video Output Interface RGB Parallel I/F (24-bit)  
RGB Serial I/F (8-bit)  
i80-System I/F (18-bit)
- PIP (OSD) function Supports X,Y indexed position  
Supports 4-bit Alpha blending :  
Plane / Pixel(only supports 24-bit 8:8:8 mode)
- Source format Window 0 :  
- Supports 1, 2, 4 or 8-bpp palletized color  
- Supports 16, 18 or 24-bpp non-palletized color  
  
Window 1 :  
- Supports 1, 2, 4 or 8-bpp palletized color  
- Supports 16, 18 or 24-bpp non-palletized color
- Configurable Burst Length Programable 4/ 8/ 16 Burst DMA
- Palette/Look-up table 256 x 25(ARGB) bits palette (2ea for Window 0, Window1)
- Soft Scrolling Horizontal : 1 Byte resloution  
Vertical : 1 pixel resolution
- Virtual Screen Virtual image can has up to 1Mbyte image size.
- Transparent Overlay Support Transparent Overlay
- Color Key (Chroma Key) Support Color key function
- Duble Buffering Frame buffer alternating by one control bit
- Dithering Patented 4x4 dither matrix implemetation

## 2 FUNCTIONAL DESCRIPTION

### 2.1 BRIEF OF THE SUB-BLOCK

The LCD controller consists of a VSFR, VDMA, VPRCS, VTIME, and video clock generator. The VSFR has 71 programmable register sets and two-256x25 palette memory, which are used to configure the LCD controller. The VDMA is a dedicated LCD DMA, which it can transfer the video data in frame memory to VPRCS. By using this special DMA, the video data can be displayed on the screen without CPU intervention. The VPRCS receives the video data from VDMA and sends the video data through the data ports (RGB\_VD, VEN\_VD, or SYS\_VD ) to the display device (LCD) after changing them into a suitable data format, for example 8-bit per pixel mode (8 BPP Mode) or 16-bit per pixel mode (16 BPP Mode). The VTIME consists of programmable logic to support the variable requirement of interface timing and rates commonly found in different LCD drivers. The VTIME block generates RGB\_VSYNC, RGB\_HSYNC, RGB\_VCLK, RGB\_VDEN, SYS\_CS1, SYS\_CS0, and so on.

### 2.2 DATA FLOW

FIFO is present in the VDMA. When FIFO is empty or partially empty, VDMA requests data fetching from the frame memory based on the burst memory transfer mode(Consecutive memory fetching of 4 / 8 / 16 words per one burst request without allowing the bus mastership to another bus master during the bus transfer). When bus arbitrator in the memory controller accepts this kind of transfer request, there will be 4 / 8 / 16 successive word data transfers from system memory to internal FIFO. The each size of FIFO is 32 words. The LCD controller has two FIFOs because it needs to support the overlay window mode. In case of one screen display mode, the only one FIFO should be used. The data through FIFO is fetched by VPRCS which has a blending, scheduling function for the final image data. VPRCS supports overlay function that enables to overlay any image up to 2 window images whose is smaller or same size can be blended with main window image with programmable alpha blending or color (chroma) key function. Fig. 22-2 shows the data flow from system bus to the output buffer. VDMA has two DMA channels. Alpha values written in SFR determine the level of blending. Data from Output buffer will be appearing to the Video Data Port.

Figure 22-2. Block diagram of the Data Flow

### 2.3 INTERFACE

LCD controller supports 2 types of display device. One type is the conventional RGB-interface that uses RGB data, Vertical/horizontal sync, data valid signal and data sync clock. The Second type is i80-System interface that uses address, data, chip select, read/write control and register/status indicating signal. In this type of LCD driver, it has a frame buffer and has the function of self-refresh, so LCD controller updates one still image by writing only one time to the LCD.

## 2.4 OVERVIEW OF THE COLOR DATA

### 2.4.1 RGB Data format

The LCD controller requests the specified memory format of frame buffer. The next table shows some examples of each display mode.

### 2.4.2 28BPP display (A4+888)

(BSWP = 0, HWSWP = 0, BLD\_PIX = 1, ALPHA\_SEL = 1)

|      | D[31:28]  | D[27:24]    | D[23:0] |
|------|-----------|-------------|---------|
| 000H | Dummy Bit | Alpha value | P1      |
| 004H | Dummy Bit | Alpha value | P2      |
| 008H | Dummy Bit | Alpha value | P3      |
| ...  |           |             |         |

**NOTE:** D[23:16] = Red data, D[15:8] = Green data, D[7:0] = Blue data

In case of BLD\_PIX and ALPHA\_SEL are set,  
D[27:24] = Alpha value, D[23:16] = Red data, D[15:8] = Green data, D[7:0] = Blue data

### 2.4.3 25BPP display (A888)

(BSWP = 0, HWSWP = 0)

|      | D[31:25]  | D[24] | D[23:0] |
|------|-----------|-------|---------|
| 000H | Dummy Bit | AEN   | P1      |
| 004H | Dummy Bit | AEN   | P2      |
| 008H | Dummy Bit | AEN   | P3      |
| ...  |           |       |         |

#### NOTES:

1. AEN : Select Alpha value in Window 1 Alpha Value Register for alpha blending  
AEN = 0 : ALPHA0\_R/G/B values are applied.  
AEN = 1 : ALPHA1\_R/G/B values are applied.  
Each pixel of LCD panel displays blended color with lower layer window.  
Refer to the equation of alpha blending on page 22-22.
2. D[23:16] = Red data, D[15:8] = Green data, D[7:0] = Blue data

#### 2.4.4 24BPP display (A887)

(BSWP = 0, HWSWP = 0)

|      | D[31:24]  | D[23] | D[22:0] |
|------|-----------|-------|---------|
| 000H | Dummy Bit | AEN   | P1      |
| 004H | Dummy Bit | AEN   | P2      |
| 008H | Dummy Bit | AEN   | P3      |
| ...  |           |       |         |

#### NOTES:

1. AEN : Select Alpha value in Window 1 Alpha Value Register for alpha blending  
AEN = 0 : ALPHA0\_R/G/B values are applied.  
AEN = 1 : ALPHA1\_R/G/B values are applied.  
Each pixel of LCD panel displays blended color with lower layer window.  
Refer to the equation of alpha blending on page 22-22.
2. D[22:15] = Red data, D[14:7] = Green data, D[6:0] = Blue data

### 2.4.5 24BPP display (888)

(BSWP = 0, HWSWP = 0)

|      | D[31:24]  | D[23:0] |
|------|-----------|---------|
| 000H | Dummy Bit | P1      |
| 004H | Dummy Bit | P2      |
| 008H | Dummy Bit | P3      |
| ...  |           |         |

**NOTE:** D[23:16] = Red data, D[15:8] = Green data, D[7:0] = Blue data

### 2.4.6 19BPP display (A666)

(BSWP = 0, HWSWP = 0)

|      | D[31:19]  | D[18] | D[17:0] |
|------|-----------|-------|---------|
| 000H | Dummy Bit | AEN   | P1      |

## 2.6 PALETTE USAGE

### 2.6.1 Palette Configuration and Format Control

The LCD controller can support the 256 colors palette for various selection of color mapping.

The user can select 256 colors from the 24-bit colors through these four formats.

256 colors palette consist of the 256(depth) × 25-bit DPSRAM. Palette supports 8:8:8, 6:6:6, 5:6:5(R:G:B), and etc format.

For example of A:5:5:5 format, write palette like Table 22-3 and then connect VD pin to LCD panel( R(5)=VD[23:19], G(5)=VD[15:11], and B(5)=VD[7:3] ). Select Alpha value in Window 1 Alpha Value Register. At the last, Set Window Palette Control(**WOPAL, case window0**) register to 0'b101.

**Table 22-1. 25BPP(A:8:8:8) Palette Data Format**

### 3 WINDOW BLENDING

#### 3.1 OVERVIEW

The main function of the VPRCS module is window blending. LCD controller has 2-window layers and the detail is described below. As an example of application, System can use win0 as an OS window, full TV screen window or etc. This feature enhances the system performance by reducing the data rate of total system.

##### 3.1.1 Total 2 windows

Window 0 (base) : RGB with palette

Window 1 (overlay) : RGB with palette

##### 3.1.2 Overlay Priority

$Win\ 1 > Win\ 0$

##### 3.1.3 Blending equation

$$WinOut(R) = Win0(R) \times (1-AR) + Win1(R) \times AR$$

$$WinOut(G) = Win0(G) \times (1-AG) + Win1(G) \times AG$$

$$WinOut(B) = Win0(B) \times (1-AB) + Win1(B) \times AB$$

Where,

$AR = Win1$ 's Red blending factor( $ALPHA0\_R/16$  or  $ALPHA1\_R/16$  or  $DATA[27:24]/16$ ,  $AR$  range is 0~1)

$AG = Win1$ 's Green blending factor( $ALPHA0\_G/16$  or  $ALPHA1\_G/16$  or  $DATA[27:24]/16$ ,  $AG$  range is 0~1)

$AB = Win1$ 's Blue blending factor( $ALPHA0\_B/16$  or  $ALPHA1\_B/16$  or  $DATA[27:24]/16$ ,  $AB$  range is 0~1)

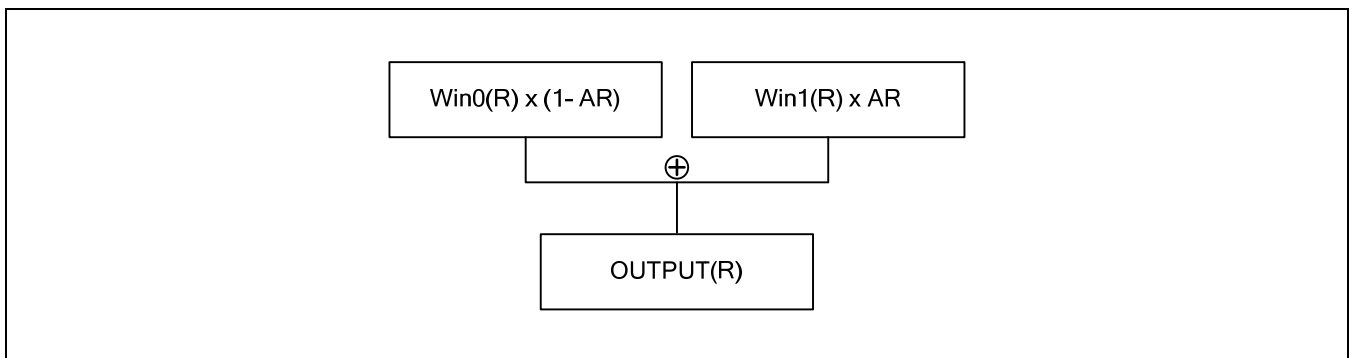

Figure 22-5. Blending Operations

### 3.2 BLENDING DIAGRAM/DETAILS

LCD controller could blend 2-Layer for the only one pixel at the same time. The Blending factor, alpha value is controlled by ALPHA0\_R/G/B and ALPHA1\_R/G/B fields in Window 1 Alpha Value register or DATA[27:24] in frame buffer, which are implemented for each window layer and color(R,G,B). As a special feature, between two windows have two kinds of alpha blending value. One is ALPHA0\_R/G/B(AEN=0) and the other is ALPHA1\_R/G/B(AEN=1).

**Table 22-4. Alpha Value Selection Table for Blending**

|                              |                              |  |              |              |
|------------------------------|------------------------------|--|--------------|--------------|
| BLD_PIX = 0<br>(WINCON1[6])  | ALPHA_SEL = 0<br>@WINCON1[1] | ALPHA0_R/G/B                               |              |              |
|                              | ALPHA_SEL = 1<br>@WINCON1[1] | ALPHA1_R/G/B                               |              |              |
| BLD_PIX = 1<br>@WINCON1[6]   | ALPHA_SEL = 0<br>@WINCON1[1] | KEYBLEND = 0<br>@W1KEYCON0[26]             | AEN = 0      | ALPHA0_R/G/B |
|                              |                              |  | AEN = 1      | ALPHA1_R/G/B |
|                              | ALPHA_SEL = 1<br>@WINCON1[1] | KEYBLEND = 1<br>@W1KEYCON0[26]             | Non-Key area | ALPHA0_R/G/B |
|                              |                              |  | Key area     | ALPHA1_R/G/B |
| ALPHA_SEL = 1<br>@WINCON1[1] |                              | DATA[27:24] in frame buffer for 28bpp mode |              |              |

#### 3.2.1 COLOR-KEY FUNCTION

The LCD controller can support color-key function for the various effect of image mapping. Color image of OSD layer, which is specified by COLOR-KEY register, will be substituted by background image for special functionality, as cursor image or pre-view image of the camera.

*The register value to ColorKey reg must be set in 24bit RGB format.*

DIRCON (in Win1 Color Key 0 register) bit selects the window to be compared with COLVAL (in Win1 Color Key 1 Register). If this bit is set to '0', the comparison window is window1 (foreground window).

COMPKEY (in Win1 Color Key 0 register) value decides whether to compare COLVAL and selected window color. In other words, the comparator only compares COLVAL and selected window color bits where the corresponding bit in COMPKEY is '0'.

Figure 22-6. Color Key Block Diagram

Figure 22-7. Color Key Operations

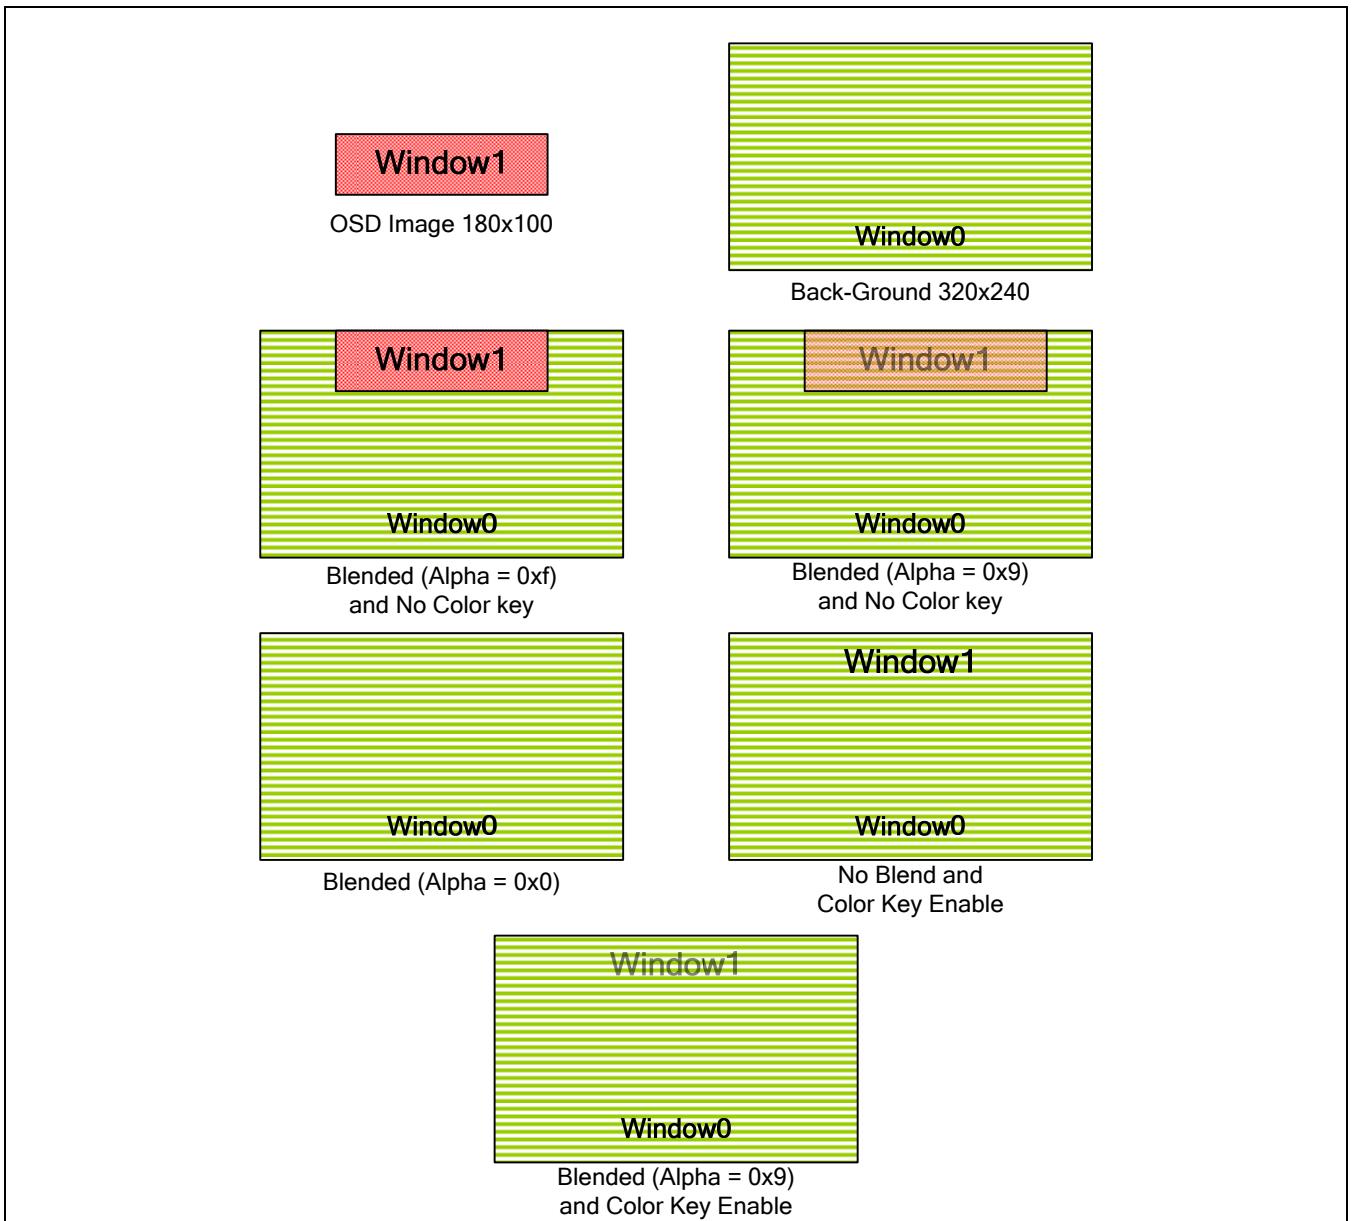

Figure 22-8. Color Key Function Configurations

## 4 VTIME CONTROLLER OPERATION

### 4.1 RGB INTERFACE

The VTIME generates the control signals such as, RGB\_VSYNC, RGB\_HSYNC, RGB\_VDEN and RGB\_VCLK signal for RGB interface. These control signals are highly related with the configuration on the VIDTCON0/1/2 registers in the VSFR register. Base on these programmable configurations of the display control registers in VSFR, the VTIME module can generate the programmable control signals suitable for the support of many different types of display device.

The RGB\_VSYNC signal is asserted to cause the LCD's line pointer to start over at the top of the display. The RGB\_VSYNC and RGB\_HSYNC pulse generation is controlled by the configuration of both the HOZVAL field and the LINEVAL registers. The HOZVAL and LINEVAL can be determined by the size of the LCD panel according to the following equations:

$$\text{HOZVAL} = (\text{Horizontal display size}) - 1$$

$$\text{LINEVAL} = (\text{Vertical display size}) - 1$$

The rate of RGB\_VCLK signal can be controlled by the CLKVAL field in the VIDCON0 register. The table below defines the relationship of RGB\_VCLK and CLKVAL. The minimum value of CLKVAL is 1.

$$\text{RGB\_VCLK (Hz)} = \text{HCLK} / [\text{CLKVAL} + 1]$$

**Table 22-5. Relation between VCLK and CLKVAL (Freq. of Video Clock Source=60MHz)**

| CLKVAL | 60MHz/X   | VCLK     |
|--------|-----------|----------|
| 1      | 60 MHz/2  | 30.0 MHz |
| 2      | 60 MHz/3  | 15.0 MHz |
| :      | :         | :        |
| 63     | 60 MHz/64 | 938 kHz  |

The RGB\_HSYNC and RGB\_VSYNC signal is configured by RGB\_VSYNC, VBPD, VFPD, HSYNC, HBPD, HFPD, HOZVAL and LINEVAL. Refer the Figure 22-10.

The frame rate is RGB\_VSYNC signal frequency. The frame rate is related with the field of RGB\_VSYNC, VBPD, VFPD, LINEVAL, HSYNC, HBPD, HFPD, HOZVAL, CLKVAL registers. Most LCD drivers need their own adequate frame rate. The frame rate is calculated as follows;

$$\text{Frame Rate} = 1 / [ \{ (\text{VSPW} + 1) + (\text{VBPD} + 1) + (\text{LINEVAL} + 1) + (\text{VFPD} + 1) \} \times \{ (\text{HSPW} + 1) + (\text{HBPD} + 1) + (\text{HFPD} + 1) + (\text{HOZVAL} + 1) \} \times \{ (\text{CLKVAL} + 1) \} / (\text{Frequency of Clock source}) ]$$

### 4.2 i80-SYSTEM INTERFACE

The VTIME generates the control signals such as, SYS\_CS0, SYS\_CS1, SYS\_RS and SYS\_WE signal for i80-System Interface. The LCDIFMODE, LCD\_CS\_SETUP, LCD\_WAIT\_WR and LCD\_HOLD\_WR registers control these signals. Refer to figure 22-11.

### 5 VIRTUAL DISPLAY

The LCD controller supports the hardware horizontal or vertical scrolling. If the screen is scrolled, the fields of LCDBASEU and LCDBASEL registers need to be changed (refer to Figure 22-9), but PAGEWIDTH and OFFSIZE value do not change. The size of video buffer in which the image is stored should be larger than the LCD panel screen size.

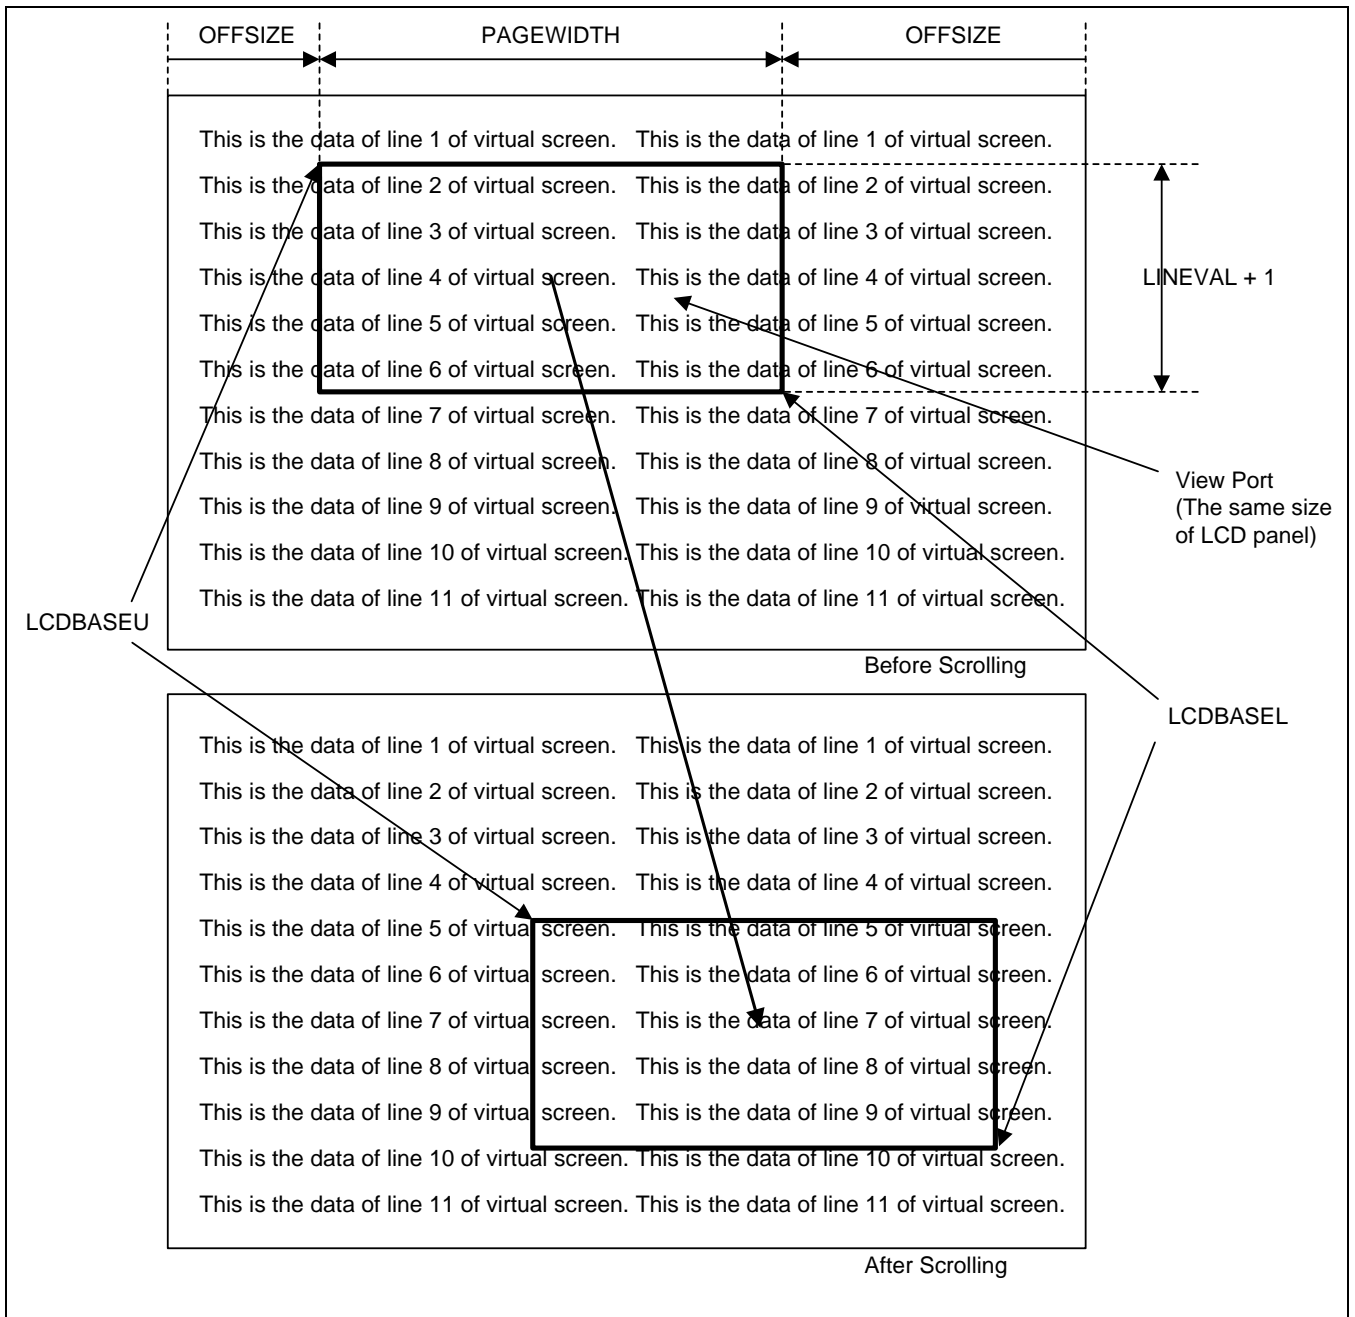

Figure 22-9. Example of Scrolling in Virtual Display

## 6 RGB INTERFACE I/O

### 6.1.1 Signals

| Name         | Type   | Description             |
|--------------|--------|-------------------------|
| RGB_HSYNC    | Output | Horizontal Sync. Signal |
| RGB_VSYNC    | Output | Vertical Sync. Signal   |
| RGB_VCLK     | Output | LCD Video Clock         |
| RGB_VDEN     | Output | Data Enable             |
| RGB_VD[23:0] | Output | RGB data output         |

### 6.1.2 RGB I/F Timing

Figure 22-10. LCD RGB Interface Timing

## 7 LCD CPU INTERFACE I/O (i80-SYSTEM I/F)

### 7.1.1 Signals

| Name         | Type   | Description              |
|--------------|--------|--------------------------|
| SYS_VD[17:0] | InOut  | Video Data               |
| SYS_CS0      | Output | Chip select for Main LCD |
| SYS_CS1      | Output | Chip select for Sub LCD  |
| SYS_WR       | Output | Write enable             |
| SYS_OE       | Output | Output enable            |
| SYS_RS       | Output | Register/State select    |

### 7.1.2 CPU (i80-System) I/F Timing

|                   | 01     | Reserved  |
|                   | 00     | RGB_VD    |

- VIDOUT values are defined in VIDCON0[23:22]

## 8 PROGRAMMER'S MODEL

### 8.1 OVERVIEW

The following registers are used to configure LCD controller

1. VIDCON0: Configure Video output format and display enable/disable.
2. VIDCON1: RGB I/F control signal.
3. SYSIFCONx: i80-System I/F control signal.
4. VIDTCONx: Configure Video output Timing and determine the size of display.
5. WINCONx: Each window format setting
6. VIDOSDxA, VIDOSDxB: Window position setting
7. VIDOSDxC: Alpha value setting
8. VIDWxxADDx: Source image address setting
9. WxKEYCONx: Color key value register
10. WINxMAP: Window color control
11. WPALCON: Palette control register
12. WxPDATAxx: Window Palette Data of the each Index

#### 8.1.1 Register Descriptions

| Register     | Address    | R/W | Description  | Reset Value |
|--------------|------------|-----|--|-------------|
| VIDCON0      | 0x4C800000 | R/W | Video control 0 register                           | 0x0000_0000 |

## 8.1.2 Video Main Control 0 Register

| Register | Address    | R/W | Description              | Reset Value |
|----------|------------|-----|--------------------------|-------------|
| VIDCON0  | 0x4C800000 | R/W | Video control 1 register | 0x0000_0000 |

| VIDCON0   | Bit     | Description  | Initial State |
|-----------|---------|--|---------------|
| Reserved  | [31:24] | Reserved   | 0x00          |
| VIDOUT    | [23:22] | It determines the output format of LCD Controller<br>00 = RGB I/F<br>01 = Reserved<br>10 = i80-System I/F for Main LDI<br>11 = i80-System I/F for Sub LDI  | 0             |
| L1_DATA16 | [21:19] | Select the mode of output data format of i80-System I/F (Sub LDI.)<br>(Only when, VIDOUT == 2'b11)<br>000 = 16-bit mode (16 bpp)<br>001 = 16 + 2 bit mode (18 bpp)<br>010 = 9 + 9 bit mode (18 bpp)<br>011 = 16 + 8 bit mode (24 bpp)<br>100 = 18-bit mode (18bpp)           | 000           |
| L0_DATA16 | [18:16] | Select the mode of output data format of i80-System I/F (Main LDI.)<br>(Only when, VIDOUT == 2'b10)<br>000 = 16 bit mode (16 bpp)<br>001 = 16 + 2 bit mode (18 bpp)<br>010 = 9 + 9 bit mode (18 bpp)<br>011 = 16 + 8 bit mode (24 bpp)<br>100 = 18 bit mode (18bpp)          | 000           |
| Reserved  | [15]    | Reserved   | 0             |
| PNRMODE   | [14:13] | Select the display mode. (Where, VIDOUT == 2'b00)<br>00 = RGB Parallel format (RGB)<br>01 = RGB Parallel format (BGR)<br>10 = Serial Format (R->G->B)<br>11 = Serial Format (B->G->R)<br>Select the display mode. (Where, VIDOUT == 2'b1x)<br>00 = RGB Parallel format (RGB) | 00            |

## 8.1.3 Video Main Control 0 Register (Continued)

| VIDCON0  | Bit    | Description   | Initial State |
|----------|--------|---|---------------|
| CLKVALUP | [12]   | Select CLKVAL_F Update timing control<br>0 = Always<br>1 = Start of a frame (Only once per frame)   | 0             |
| CLKVAL_F | [11:6] | Determine the rates of VCLK.<br>$VCLK = (HCLK \text{ or } LCD \text{ video Clock}) / [CLKVAL+1] \text{ ( } CLKVAL \geq 1 \text{ )}$   | 0             |
| VCLKEN   | [5]    | VCLK Enable Control<br>0 = Disable<br>1 = Enable  | 0             |
| CLKDIR   | [4]    | Select the clock source as direct or divide using CLKVAL_F register.<br>0 = Direct clock (frequency of VCLK = frequency of Clock source)<br>1 = Divided using CLKVAL_F  | 0             |
| CLKSEL_F | [3:2]  | Select the Video Clock source<br>00 = HCLK<br>01 = LCD video Clock (from SYSCON EPLL)<br>10 = Reserved<br>11 = Reserved   | 0             |
| ENVID    | [1:0]  | Video output and the LCD logics enable/disable control.<br>00 = Disable video signals and logics <u>immediately</u> .<br>01 = Reserved.<br>10 = Disable video signals and logics <u>at the end of current frame</u> .<br>11 = Enable video output and logics.<br><br><b>Note :</b> If set to '10b' in the middle of displaying current frame, the value of ENVID is still '11b'. However, the LCD functions are disabled at the end of current frame and the value is changed to '10b'. | 0             |

## 8.1.4 Video Main Control 1 Register

| Register | Address    | R/W | Description              | Reset Value |
|----------|------------|-----|--------------------------|-------------|
| VIDCON1  | 0x4C800004 | R/W | Video control 2 register | 0x0000_0000 |

| VIDCON1                | Bit     | Description  | Initial state |
|------------------------|---------|--|---------------|
| LINECNT<br>(read only) | [26:16] | Provide the status of the line counter (read only)<br>Up count from 0 to LINEVAL   | 0             |
| Reserved               | [15]    | Reserved   | 0             |
| VSTATUS                | [14:13] | Vertical Status (read only).<br>00 = VSYNC                      01 = BACK Porch<br>10 = ACTIVE                      11 = FRONT Porch                               | 0             |
| HSTATUS                | [12:11] | Horizontal Status (read only).<br>00 = HSYNC                      01 = BACK Porch<br>10 = ACTIVE                      11 = FRONT Porch                             | 0             |
| Reserved               | [10:8]  | Reserved   |               |
| IVCLK                  | [7]     | This bit controls the polarity of the VCLK active edge.<br>0 = The video data is fetched at VCLK falling edge<br>1 = The video data is fetched at VCLK rising edge | 0             |
| IHSYNC                 | [6]     | This bit indicates the HSYNC pulse polarity.<br>0 = normal(active high)                      1 = inverted(active low)  | 0             |
| IVSYNC                 | [5]     | This bit indicates the VSYNC pulse polarity.<br>0 = normal(active high)                      1 = inverted(active low)  | 0             |
| IVDEN                  | [4]     | This bit indicates the VDEN signal polarity.<br>0 = normal(active high)                      1 = inverted(active low)  | 0             |
| Reserved               | [3:0]   | Reserved   | 0x0           |

## 8.1.5 VIDEO Time Control 0 Register

| Register | Address    | R/W | Description                   | Reset Value |
|----------|------------|-----|-------------------------------|-------------|
| VIDTCON0 | 0x4C800008 | R/W | Video time control 1 register | 0x0000_0000 |

| VIDTCON0 | Bit     | Description  | Initial State |
|----------|---------|--|---------------|
| VBPD     | [23:16] | Vertical back porch is the number of inactive lines at the start of a frame, after vertical synchronization period. (Period : VBPD +1) | 0x00          |
| VFPD     | [15:8]  | Vertical front porch is the number of inactive lines at the end of a frame, before vertical synchronization period. (Period : VFPD +1) | 0x00          |
| VSPW     | [7:0]   | Vertical sync pulse width determines the VSYNC pulse's level width by counting the number of inactive lines.<br>(Period : VSPW +1)     | 0x00          |

## 8.1.6 Video Time Control 1 Register

| Register | Address    | R/W | Description                   | Reset Value |
|----------|------------|-----|-------------------------------|-------------|
| VIDTCON1 | 0x4C80000C | R/W | Video time control 2 register | 0x0000_0000 |

| VIDTCON1 | Bit     | Description  | Initial state |
|----------|---------|--|---------------|
| HBPD     | [23:16] | Horizontal back porch is the number of VCLK periods between the edge of HSYNC and the start of active data.<br>(Period : HBPD +1)<br><b>Note:</b> Set 0x10 for i80-System Interface<br>When the PNRMODE (VIDCON0 [14:13]) is set to serial format the period becomes 3 times of HBPD value.<br>(If HBPD is set to '0' in serial mode, the period becomes 3-VLCK) | 0000000       |
| HFPD     | [15:8]  | Horizontal front porch is the number of VCLK periods between the end of active data and the edge of next HSYNC.<br>(Period : HFPD +1)<br><b>Note:</b> When the PNRMODE(VIDCON0[14:13]) is set to serial format the period of HFPD becomes 3 times of VCLK<br>(If HFPD is set to '0' in serial mode, the period becomes 3-VLCK)                                   | 0x00          |
| HSPW     | [7:0]   | Horizontal sync pulse width determines the HSYNC pulse's level width by counting the number of the VCLK.<br>(Period : HSPW +1)<br><b>Note:</b> When the PNRMODE(VIDCON0[14:13]) is set to serial format the period of HSPW becomes 3 times of VCLK<br>(If HSPW is set to '0' in serial mode, the period becomes 3-VLCK)  | 0x00          |

## 8.1.7 VIDEO Time Control 2 Register

| Register | Address    | R/W | Description                   | Reset Value |
|----------|------------|-----|-------------------------------|-------------|
| VIDTCON2 | 0x4C800010 | R/W | Video time control 3 register | 0x0000_0000 |

| VIDTCON2 | Bit     | Description   | Initial state |
|----------|---------|---|---------------|
| LINEVAL  | [21:11] | These bits determine the vertical size of display   | 0             |
| HOZVAL   | [10:0]  | These bits determine the horizontal size of display | 0             |

## 8.1.8 Window 0 Control Register

| Register | Address    | R/W | Description               | Reset Value |
|----------|------------|-----|---------------------------|-------------|
| WINCON0  | 0x4C800014 | R/W | Window 0 control register | 0x0000_0000 |

| WINCON0   | Bit     | Description   | Initial State |
|-----------|---------|---|---------------|
| BUFSTATUS | [24]    | Status of Current display Buffer (Read only)<br>0 = buffer0 display      1 = buffer1 display<br><b>Note:</b> RGB I/F does not support auto-change mode.<br>Only i80-Sytem I/F supports auto-change mode.  | 0             |
| BUFSEL    | [23]    | Select Buffer selection control<br>0 = buffer0 select      1 = buffer1 select   | 0             |
| BUFAUTOEN | [22]    | Double Buffer Auto-change control bit<br>0 = Fixed by BUFSEL<br>1 = Auto changed by SWTRIG (in CPUTRIGCON2 register)<br><b>Note:</b> RGB I/F does not support auto-change mode.<br>Only i80-Sytem I/F supports auto-change mode.  | 0             |
| BITSWP    | [18]    | Bit swap control bit.<br>0 = Swap Disable      1 = Swap Enable  | 0             |
| BYTSWP    | [17]    | Byte swaps control bit.<br>0 = Swap Disable      1 = Swap Enable  | 0             |

### 8.1.10 Window 0 Position Control A Register

| Register | Address    | R/W | Description                                | Reset Value |
|----------|------------|-----|--|-------------|
| VIDOSD0A | 0x4C800028 | R/W | Video Window 0's position control register | 0x0000_0000 |

| VIDOSD0A       | Bit     | Description  | Initial State |
|----------------|---------|--|---------------|
| OSD_LeftTopX_F | [21:11] | Horizontal screen coordinate for left top pixel of OSD image | 0             |
| OSD_LeftTopY_F | [10:0]  | Vertical screen coordinate for left top pixel of OSD image   | 0             |

### 8.1.11 Window 0 Position Control B Register

| Register | Address    | R/W | Description                                | Reset Value |
|----------|------------|-----|--|-------------|
| VIDOSD0B | 0x4C80002C | R/W | Video Window 0's position control register | 0x0000_0000 |

| VIDOSD0B        | Bit     | Description  | Initial State |
|-----------------|---------|--|---------------|
| OSD_RightBotX_F | [21:11] | Horizontal screen coordinate for right bottom pixel of OSD image | 0             |
| OSD_RightBotY_F | [10:0]  | Vertical screen coordinate for right bottom pixel of OSD image   | 0             |

**NOTE:** Registers must have word boundary X position.

So, 24bpp mode should have X position by 1 pixel. ( ex, X = 0,1,2,3....)

16bpp mode should have X position by 2 pixel. ( ex, X = 0,2,4,6....)

8bpp mode should have X position by 4 pixel. ( ex, X = 0,4,8,12....)

## 8.1.12 Window 1 Position Control A Register

| Register | Address    | R/W | Description                                  | Reset Value |
|----------|------------|-----|--|-------------|
| VIDOSD1A | 0x4C800034 | R/W | Video Window 1's position control 2 register | 0x0000_0000 |

| VIDOSD1A       | Bit     | Description  | initial state |
|----------------|---------|--|---------------|
| OSD_LeftTopX_F | [21:11] | Horizontal screen coordinate for left top pixel of OSD image | 0             |
| OSD_LeftTopY_F | [10:0]  | Vertical screen coordinate for left top pixel of OSD image   | 0             |

## 8.1.13 Window 1 Position Control B Register

| Register | Address    | R/W | Description                                | Reset Value |
|----------|------------|-----|--|-------------|
| VIDOSD1B | 0x4C800038 | R/W | Video Window 1's position control register | 0x0000_0000 |

| VIDOSD1B        | Bit     | Description  | Initial state |
|-----------------|---------|--|---------------|
| OSD_RightBotX_F | [21:11] | Horizontal screen coordinate for right bottom pixel of OSD image | 0             |
| OSD_RightBotY_F | [10:0]  | Vertical screen coordinate for right bottom pixel of OSD image   | 0             |

**NOTE:** Registers must have word boundary X position.

So, 24bpp mode should have X position by 1 pixel. ( ex, X = 0,1,2,3....)

16bpp mode should have X position by 2 pixel. ( ex, X = 0,2,4,6....)

8bpp mode should have X position by 4 pixel. ( ex, X = 0,4,8,12....)

## 8.1.14 Window 1 Alpha Value Register

| Register | Address    | R/W | Description                           | Reset Value |
|----------|------------|-----|---------------------------------------|-------------|
| VIDOSD1C | 0x4C80003C | R/W | Video Window 1's alpha value register | 0x0000_0000 |

| ALPHAVAL | Bit     | Description        | Initial state |
|----------|---------|--------------------|---------------|
| Reserved | [31:24] | Reserved           | 0             |
| ALPHA0_R | [23:20] | Red Alpha0 value   | 0             |
| ALPHA0_G | [19:16] | Green Alpha0 value | 0             |
| ALPHA0_B | [15:12] | Blue Alpha0 value  | 0             |
| ALPHA1_R | [11:8]  | Red Alpha1 value   | 0             |
| ALPHA1_G | [7:4]   | Green Alpha1 value | 0             |
| ALPHA1_B | [3:0]   | Blue Alpha1 value  | 0             |

## 8.1.15 FRAME Buffer Address 0 Register

| Register     | Address    | R/W | Description  | Reset Value |
|--------------|------------|-----|--|-------------|
| VIDW00ADD0B0 | 0x4C800064 | R/W | Window 0's buffer start address register, buffer 0 | 0x0000_0000 |
| VIDW00ADD0B1 | 0x4C800068 | R/W | Window 0's buffer start address register, buffer 1 | 0x0000_0000 |
| VIDW01ADD0   | 0x4C80006C | R/W | Window 1's buffer start address register           | 0x0000_0000 |

| VIDWxxADD0 | Bit     | Description  | Initial State |
|------------|---------|--|---------------|
| VBANK_F    | [31:24] | These bits indicate A[31:24] of the bank location for the video buffer in the system memory. | 0x0           |
| VBASEU_F   | [23:0]  | These bits indicate A[23:0] of the start address of the Video frame buffer.                  | 0x0           |

## 8.1.16 FRAME Buffer Address 1 Register

| Register     | Address    | R/W | Description                                      | Reset Value |
|--------------|------------|-----|--|-------------|
| VIDW00ADD1B0 | 0x4C80007C | R/W | Window 0's buffer end address register, buffer 0 | 0x0000_0000 |
| VIDW00ADD1B1 | 0x4C800080 | R/W | Window 0's buffer end address register, buffer 1 | 0x0000_0000 |
| VIDW01ADD1   | 0x4C800084 | R/W | Window 1's buffer end address register           | 0x0000_0000 |

| VIDWxxADD1 | Bit    | Description   | Initial State |
|------------|--------|---|---------------|
| VBASEL_F   | [23:0] | These bits indicate A[23:0] of the end address of the Video frame buffer.<br>$VBASEL = VBASEU + (PAGEWIDTH+OFFSIZE) \times (LINEVAL+1)$ | 0x0           |

## 8.1.17 FRAME Buffer Address 2 Register(Virtual screen)

| Register     | Address    | R/W | Description                               | Reset Value |
|--------------|------------|-----|---|-------------|
| VIDW00ADD2B0 | 0x4C800094 | R/W | Window 0's buffer size register, buffer 0 | 0x0000_0000 |
| VIDW00ADD2B1 | 0x4C800098 | R/W | Window 0's buffer size register, buffer 1 | 0x0000_0000 |
| VIDW01ADD2   | 0x4C80009C | R/W | Window 1's buffer size register           | 0x0000_0000 |

| VIDWxxADD2  | Bit     | Description   | Initial State |
|-------------|---------|---|---------------|
| OFFSIZE_F   | [25:13] | Virtual screen offset size (the number of byte)<br>This value defines the difference between the address of the last byte displayed on the previous Video line and the address of the first byte to be displayed in the new Video line.<br>OFFSIZE_F must have value more than burst size value or 0. | 0             |
| PAGEWIDTH_F | [12:0]  | Virtual screen page width (the number of byte)<br>This value defines the width of the view port in the frame.<br>PAGEWIDTH must have the value, which is multiple of the burst size.  | 0             |

## 8.1.18 VIDEO Interrupt Control Register

| Register  | Address    | R/W | Description                                   | Reset Value |
|-----------|------------|-----|---|-------------|
| VIDINTCON | 0x4C8000AC | R/W | Indicate the Video interrupt control register | 0x3F00000   |

| VIDINTCON    | Bit     | Description  | Initial state |
|--------------|---------|--|---------------|
| FIFOINTERVAL | [25:20] | These bits control the interval of the FIFO interrupt.   | 0x3F          |
| SYSMAINCON   | [19]    | Sending complete interrupt enable bit to Main LCD<br>0 = Interrupt Disable.<br>1 = Interrupt Enable.   | 0             |
| SYSSUBCON    | [18]    | Sending complete interrupt enable bit to Sub LCD<br>0 = Interrupt Disable.<br>1 = Interrupt Enable.  | 0             |
| SYSIFDONE    | [17]    | i80-System Interface Interrupt Enable control (only for i80-System Interface mode).<br>0 = Interrupt Disable.<br>1 = Interrupt Enable.   | 0             |
| FRAMESEL0    | [16:15] | Video Frame Interrupt 0 (SUBINT_LCD3) at start of :<br>00 = BACK Porch      01 = VSYNC<br>10 = ACTIVE            11 = FRONT Porch  | 0             |
| FRAMESEL1    | [14:13] | Video Frame Interrupt 1 (SUBINT_LCD3) at start of :<br>00 = None              01 = BACK Porch<br>10 = VSYNC             11 = FRONT Porch                                       | 0             |
| INTFRMEN     | [12]    | Video Frame interrupts (SUBINT_LCD3) Enable control bit.<br>0 = Video Frame Interrupt Disable<br>1 = Video Frame Interrupt Enable  | 0             |
| FIFOSEL      | [11:5]  | FIFO Interrupt control bit, each bit has the meaning of<br>[11:7] Reserved<br>[ 6] Window 1 control ( 0: disable, 1: enable)<br>[ 5] Window 0 control ( 0: disable, 1: enable) | 0             |
| FIFOLEVEL    | [4:2]   | Video FIFO Interrupt (SUBINT_LCD2) Level Select<br>000 = 25% left      001 = 50% left<br>010 = 75% left      011 = empty            100 = full                                 | 0             |
| INTFIFOEN    | [1]     | LCD FIFO interrupt (SUBINT_LCD2) Enable control bit.<br>0 = LCD FIFO Level Interrupt Disable<br>1 = LCD FIFO Level Interrupt Enable  | 0             |
| INTEN        | [0]     | LCD interrupt (INT_LCD) Enable control bit.<br>0 = LCD Interrupt Disable<br>1 = LCD Interrupt Enable   | 0             |

**NOTE:** Frame interrupt (SUBINT\_LCD3) has two interrupt sources, which are Frame interrupt0 and 1. For example, if FRAMESEL0 is '00b' and FRAMESEL1 is '00b', then Frame interrupt (SUBINT\_LCD3) is asserted at the start of RGB\_VSYNC. If FRAMESEL0 is '00b' and FRAMESEL1 is '01b', then Frame interrupt (SUBINT\_LCD3) is asserted twice at the start of RGB\_VSYNC and BACK porch.

## 8.1.19 Win1 Color Key 0 Register

| Register  | Address   | R/W | Description                | Reset Value |
|-----------|-----------|-----|----------------------------|-------------|
| W1KEYCON0 | 0x4C800B0 | R/W | Color key control register | 0x0000_0000 |

| W1KEYCON0 | Bit    | Description  | Initial state |
|-----------|--------|--|---------------|
| KEYBLEN   | [26]   | Alpha value control for Key area or Non-Key area<br>0 = Alpha value selected by AEN bit in frame buffer<br>1 = Alpha value selected by below area<br>Non-Key area : ALPHA0_R/G/B<br>Key area : ALPHA1_R/G/B<br><b>Note:</b> This bit is meaningful when BLD_PIX is 1 and ALPHA_SEL is 0.     | 0             |
| KEYEN_F   | [25]   | Color Key (Chroma key ) Enable control<br>0 = Color key disable<br>1 = Color key enable  | 0             |
| DIRCON    | [24]   | Color key (Chroma key) direction control<br>0 = If the pixel value match fore-ground image with COLVAL, pixel from back-ground image is displayed ( only in OSD area)<br>1 = If the pixel value match back-ground with COLVAL, pixel from fore-ground image is displayed ( only in OSD area) | 0             |
| COMPKEY   | [23:0] | Each bit is correspond to the COLVAL[23:0].<br>If some position bit is set then that position bit of COLVAL will be disabled.  | 0             |

## 8.1.20 WIN 1 Color key 1 Register

| Register  | Address    | R/W | Description                                   | Reset Value |
|-----------|------------|-----|---|-------------|
| W1KEYCON1 | 0x4C8000B4 | R/W | Color key value ( transparent value) register | 0x0000_0000 |

| W1KEYCON1 | Bit    | Description                                      | Initial state |
|-----------|--------|--|---------------|
| COLVAL    | [23:0] | Color key value for the transparent pixel effect | 0             |

**NOTE:**

COLVAL and COMPKEY use 24-bit color data at all bpp mode. Unused higher bits should be '1b'.

@ BPP24 mode: 24-bit color value is valid.

## A. COLVAL

- Red: COLVAL [23:16]
- Green: COLVAL [15: 8]
- Blue: COLVAL [7:0]

## B. COMPKEY

- Red: COMPKEY [23:16]
- Green: COMPKEY [15: 8]
- Blue: COMPKEY [7:0]

@ BPP16 (5:6:5) mode: 16 bit color value is valid

## A. COLVAL

- Red: COLVAL [23:19]
- Green: COLVAL [15: 10]
- Blue: COLVAL [7:3]

## B. COMPKEY

- Red: COMPKEY [23: 19]
- Green: COMPKEY [15: 10]
- Blue: COMPKEY [7: 3]
- COMPKEY [18:16] must be '0x7'.
- COMPKEY [9: 8] must be '0x3'.
- COMPKEY [2:0] must be '0x7'.

## 8.1.21 WIN0 Color MAP

| Register | Address    | R/W | Description          | Reset Value |
|----------|------------|-----|----------------------|-------------|
| WIN0MAP  | 0x4C8000D0 | R/W | Window color control | 0x0000_0000 |

| WIN0MAP    | Bit    | Description  | Initial state |
|------------|--------|--|---------------|
| MAPCOLEN_F | [24]   | Window's color mapping control bit.<br>If this bit is enabled then Video DMA will stop, and MAPCOLOR will be appear on back-ground image instead of original image.<br>0 = disable<br>1 = enable | 0             |
| MAPCOLOR   | [23:0] | Color Value  | 0             |

## 8.1.22 WIN1 Color MAP

| Register | Address    | R/W | Description          | Reset Value |
|----------|------------|-----|----------------------|-------------|
| WIN1MAP  | 0x4C8000D4 | R/W | Window color control | 0x0000_0000 |

| WIN1MAP    | Bit    | Description   | Initial state |
|------------|--------|---|---------------|
| MAPCOLEN_F | [24]   | Window's color mapping control bit.<br>If this bit is enabled then Video DMA will stop, and MAPCOLOR will be appear on background image instead of original image.<br>0 = disable<br>1 = enable | 0             |
| MAPCOLOR   | [23:0] | Color Value   | 0             |

## 8.1.23 Window Palette control Register

| Register | Address    | R/W | Description                     | Reset Value |
|----------|------------|-----|---------------------------------|-------------|
| WPALCON  | 0x4C8000E4 | R/W | Window Palette control register | 0x0000_0000 |

| WPALCON     | Bit   | Description   | Initial state |
|-------------|-------|---|---------------|
| PALUPDATEEN | [9]   | Palette memory access-right control bit.<br>Users should set this bit before access (write or read) palette memory, in this case LCD controller cannot access palette. After update, users should clear this bit for operation of palletized LCD.<br>0: Normal Mode (LCD controller access)<br>1: Enable (ARM access) | 0             |
| W1PAL       | [5:3] | This bit determines the size of the palette data format of Window 1<br>000 = 25-bit ( A:8:8:8 )<br>001 = 24-bit ( 8:8:8 )<br>010 = 19-bit ( A:6:6:6 )<br>011 = 18-bit ( A:6:6:5 )<br>100 = 18-bit ( 6:6:6 )<br>101 = 16-bit ( A:5:5:5 )<br>110 = 16-bit ( 5:6:5 )   | 0             |

# 23 CAMERA INTERFACE

## 1 OVERVIEW

This specification defines the interface of camera. The CAMIF (Camera Interface) within the S3C2451X consists of eight parts. They are the pattern mux, capturing unit, MSDMA (Memory Scaling DMA), preview scaler, codec scaler, preview DMA, codec DMA, and SFR. The camera interface supports ITU R BT-601/656 YCbCr 8-bit standard and Memory. Maximum input size is 4096x4096 pixels (2048x2048 pixels for scaling). Two scalers exist. The one is the preview scaler, which is dedicated to generate smaller size image for preview. The other one is the codec scaler, which is dedicated to generate codec useful image like plane type YCbCr 4:2:0 or 4:2:2. Two master DMAs can do mirror and rotate the captured image for mobile environments. And test pattern generation can be used to calibration of input sync signals as HREF, VSYNC. Also, video sync signals and pixel clock polarity can be inverted in the camera interface side with using register setting.

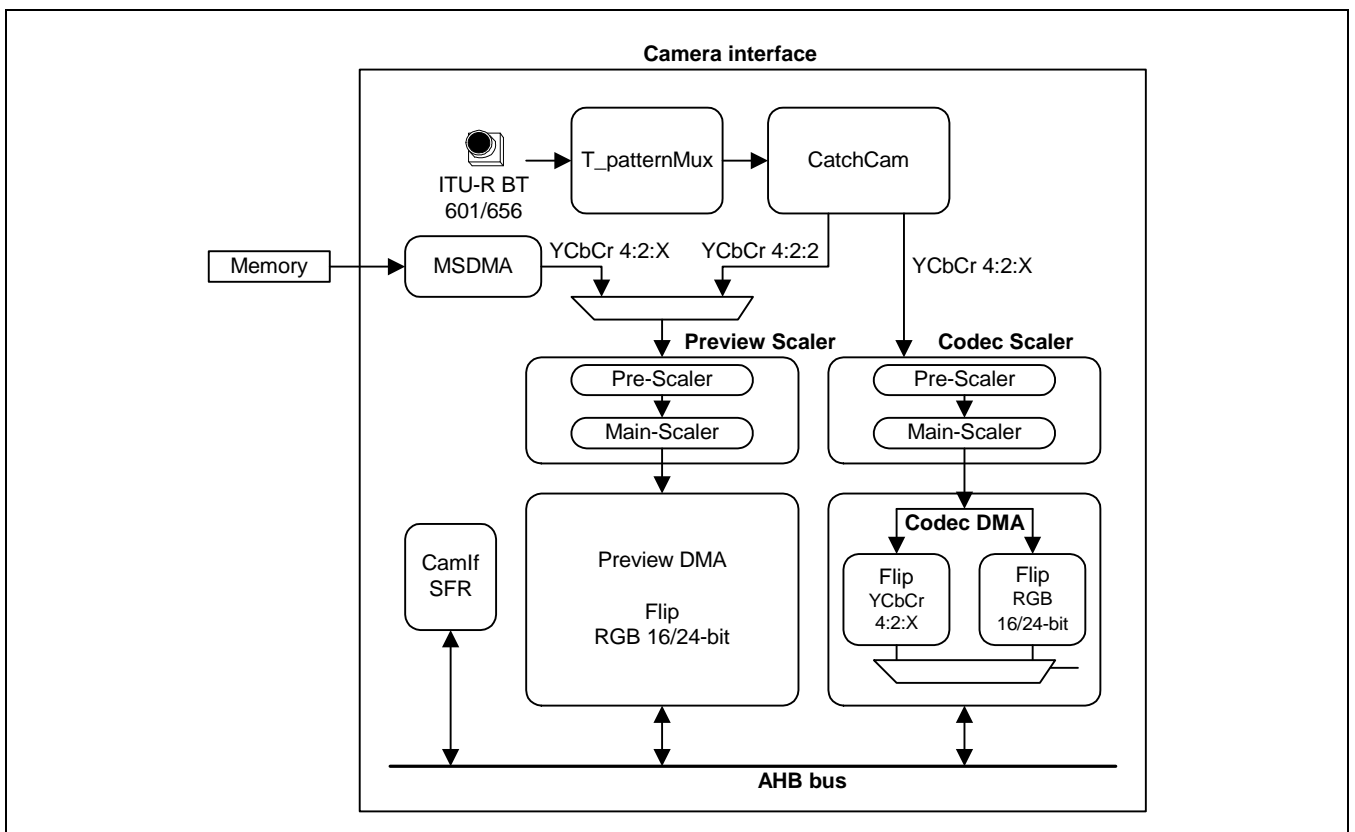

Figure 23-1. Camera interface overview

## 1.1 FEATURES

- ITU-R BT 601/656 8-bit mode support
- DZI (Digital Zoom In) capability
- Programmable polarity of video sync signals
- Max. 4096 x 4096 pixels input support (non-scaling)
- Max. 2048 x 2048 pixels input support for codec scaling and 720 x 480 pixels input support for preview scaling
- Image mirror and rotation (X-axis mirror, Y-axis mirror and 180° rotation)
- Preview DMA output image generation (RGB 16/24-bit format)
- Codec DMA output image generation (RGB 16/24-bit format or YCbCr 4:2:0/4:2:2 format)
- Capture frame control support in codec\_path
- Scan line offset support in codec\_path and preview\_path
- YCbCr 4:2:2 codec image format interleave support
- MSDMA supports memory data for preview path input.
- Image effect

## 2 EXTERNAL INTERFACE

CAMIF can support the next video standards.

- ITU-R BT 601 YCbCr 8-bit mode
- ITU-R BT 656 YCbCr 8-bit mode

### 2.1 SIGNAL DESCRIPTION

**Table 23-1. Camera interface signal description**

| Name          | I/O | Active | Description   |
|---------------|-----|--------|---|
| CAMPCLK       | I   | -      | Pixel Clock, driven by the Camera processor           |
| CAMVSYNC      | I   | H/L    | Frame Sync, driven by the Camera processor            |
| CAMHREF       | I   | H/L    | Horizontal Sync, driven by the Camera processor       |
| CAMDATA [7:0] | I   | -      | Pixel Data driven by the Camera processor             |
| CAMCLKOUT     | O   | -      | Master Clock to the Camera processors                 |
| CAMRESET      | O   | H/L    | Software Reset or Power Down for the Camera processor |
| CAM_FIELD_A   | I   | -      | Interlace field (only used in interlace mode)         |

2.2 TIMING DIAGRAM

Figure 23-2. ITU-R BT 601 Input Timing Diagram

Figure 23-3. ITU-R BT 601 Interlace Timing Diagram

Figure 23-4. ITU-R BT 656 Input Timing Diagram

There are two timing reference signals in ITU-R BT 656 format, one at the beginning of each video data block (start of active video, SAV) and one at the end of each video data block (end of active video, EAV) as shown in Figure 23-3 and below table.

**Table 23-2. Video Timing Reference Codes of ITU-656 Format**

| Data bit number | First word | Second word | Third word | Fourth word |
|-----------------|------------|-------------|------------|-------------|
| 9 (MSB)         | 1          | 0           | 0          | 1           |
| 8               | 1          | 0           | 0          | F           |
| 7               | 1          | 0           | 0          | V           |
| 6               | 1          | 0           | 0          | H           |
| 5               | 1          | 0           | 0          | P3          |
| 4               | 1          | 0           | 0          | P2          |
| 3               | 1          | 0           | 0          | P1          |
| 2               | 1          | 0           | 0          | P0          |
| 1 (Note)        | 1          | 0           | 0          | 0           |
| 0               | 1          | 0           | 0          | 0           |

**NOTE:** For compatibility with existing 8-bit interfaces, the values of bits D1 and D0 are not defined.

F = 0 (during field 1), 1 (during field 2)

V = 0 (elsewhere), 1 (during field blanking)

H = 0 (in SAV : Start of Active Video), 1 (in EAV : End of Active Video)

P0, P1, P2, P3 = protection bit

Camera interface logic can catch the video sync bits like H(SAV,EAV) and V(Frame Sync) after reserved data as "FF-00-00".

**Figure 23-5 Sync signal timing diagram**

**Table 23-3. Sync signal timing requirement**

|    | Minimum                  | Maximum |
|----|--------------------------|---------|
| t1 | 12 cycles of Pixel clock | -       |
| t2 | 12 cycles of Pixel clock | -       |
| t3 | 2 cycles of Pixel clock  | -       |
| t4 | 12 cycles of Pixel clock | -       |

Note! (t4 + t1) must be long enough to finish DMA transactions if preview is enabled or output data format of codec is RGB. Because, DMA transaction for preview and codec RGB are delayed by 4 or 8 horizontal lines.

### 3 EXTERNAL/INTERNAL CONNECTION GUIDE

All CAMIF input signals should not occur inter-skewing to pixel clock line.

Figure 23-6. IO Connection Guide

## 4 CAMERA INTERFACE OPERATION

### 4.1 TWO DMA PORTS

CAMIF has two DMA port. P-port(Preview port) and C-port(Codec port) are separated from each other on AHB bus. At the view of system bus, two ports are independent. The P-port stores the RGB image data into memory for preview. The C-port stores the YCbCr 4:2:0 or 4:2:2 image data or RGB image data into memory for Codec as MPEG-4, H.263, etc. These two master ports support the variable applications like DSC (Digital Still Camera), MPEG-4 video conference, video recording, etc. For example, P-port image can be used as preview image, and C-port image can be used as JPEG image in DSC application. Also, the register setting can separately disable P-port or C-port.

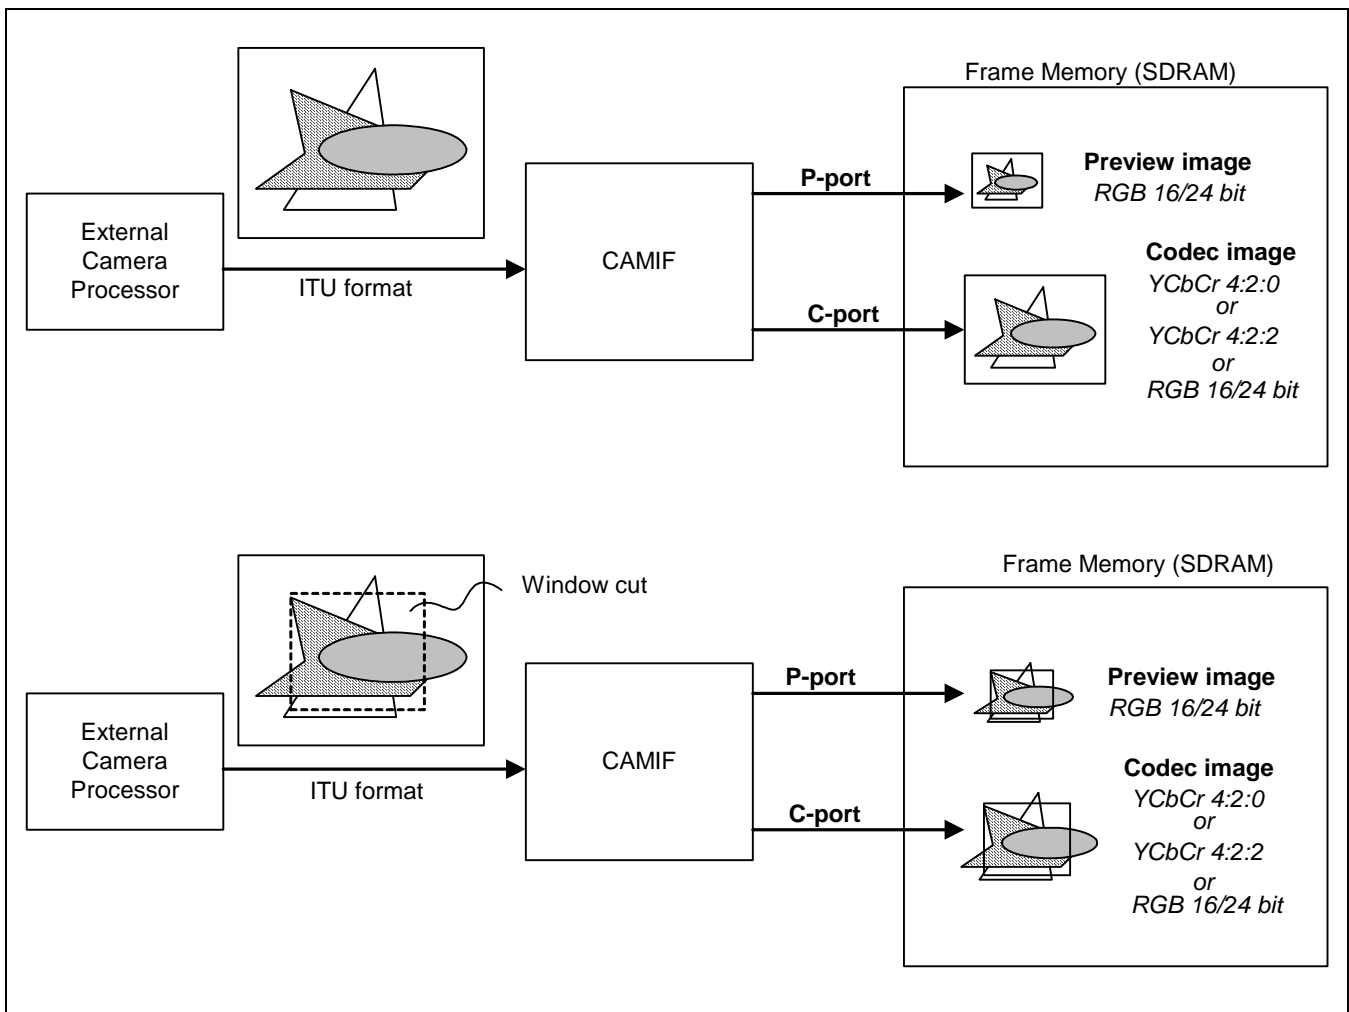

Figure 23-7. Two DMA Ports

**4.2 CLOCK DOMAIN**

CAMIF has two clock domains. The one is the system bus clock, which is HCLK. The other is the pixel clock, which is PCLK. The system clock must be faster than pixel clock. As shown in figure 23-8, CAMCLK must be divided from the fixed frequency like USB PLL clock. If external clock oscillator were used, CAMCLK should be floated. Internal scaler clock is system clock. It is not necessary for two clock domains to be synchronized each other. Other signals as PCLK should be similarly connected to shmitt-triggered level shifter.

**Figure 23-8. CAMIF Clock Generation**

**4.3 FRAME MEMORY HIRERARCHY**

Frame memories consist of four ping-pong memories for each P- and C-ports. C-port ping-pong memories have three element memories that are luminance Y, chrominance Cb, and chrominance Cr. It is recommended that the arbitration priority of CAMIF must be higher than any other masters except LCD controller. It is strongly recommended that CAMIF priorities should be the fixed priorities, not rotation priorities. And in multi-AHB bus case, the priority of system bus including CAMIF must be higher than others. If AHB-bus is traffic enough that DMA operation is not ending during one horizontal period plus blank, it might be entered into mal-function. So, the priority of CAMIF must be separated to other round robin or circular arbitration priorities. Also, it is recommended that AHB bus which include CAMIF, should have higher priority than any other multi-AHB buses in memory matrix system. And CAMIF should not be the default master of AMBA AHB system.

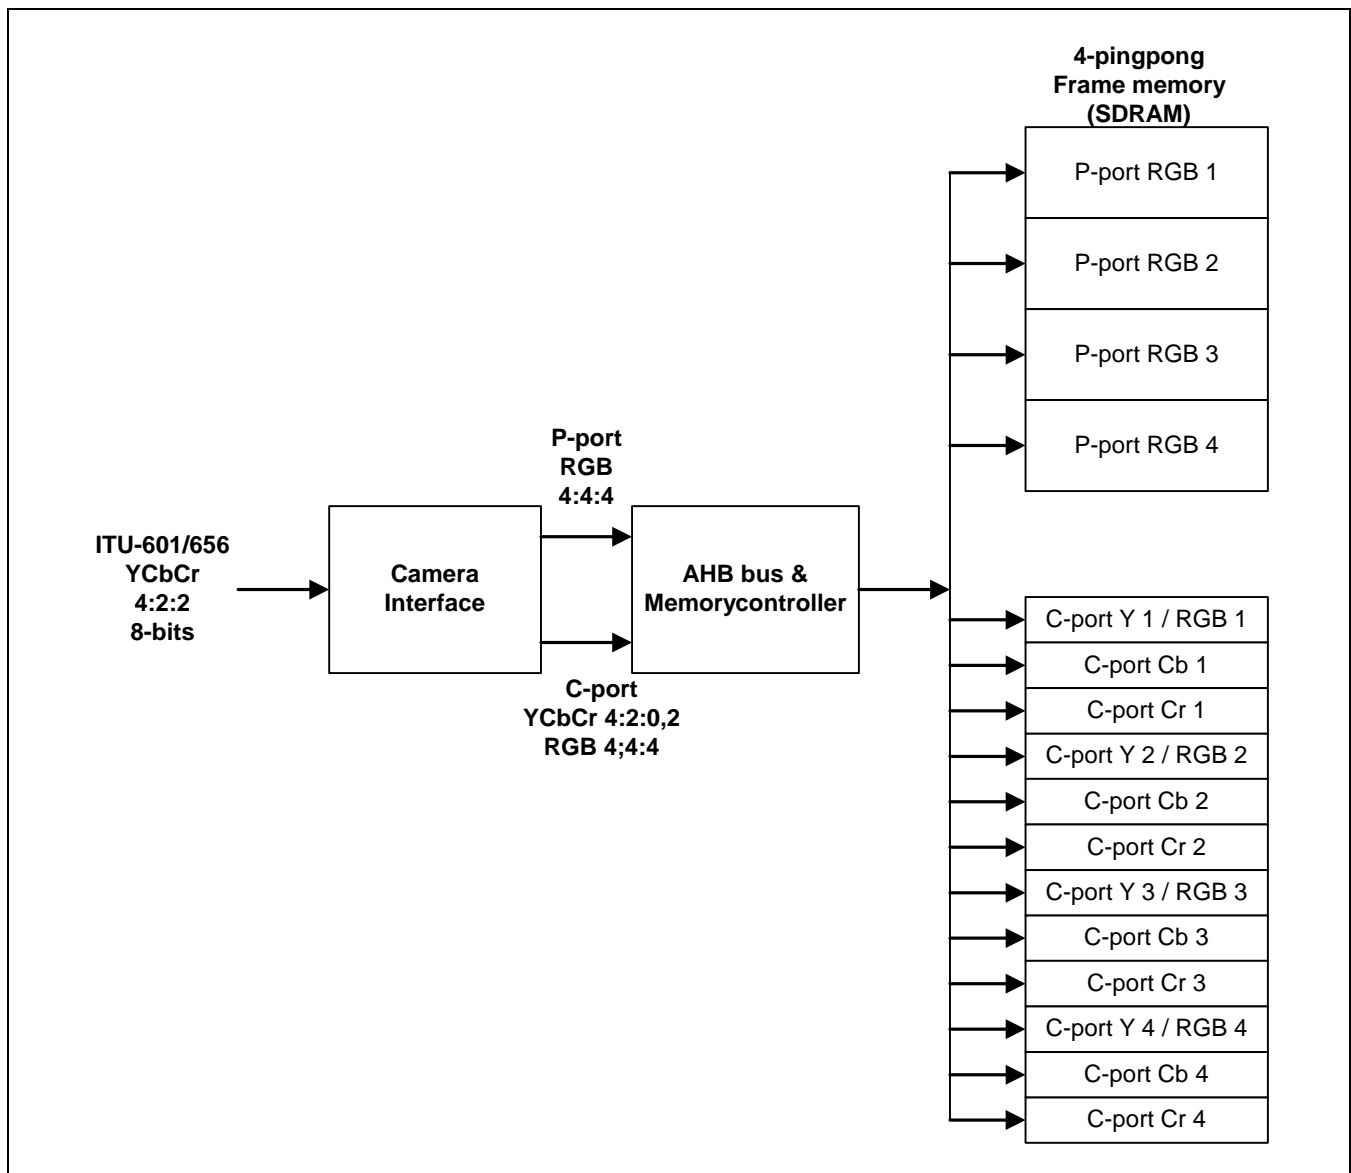

Figure 23-9. Ping-pong Memory Hierarchy

4.4 MEMORY STORING METHOD

The storing method to the frame memory is the little-endian method in codec path. The first entering pixels stored into LSB sides, and the last entering pixels stored into MSB sides. The carried data by AHB bus is 32-bit word. So, CAMIF make the each Y-Cb-Cr words by little endian style. For RGB format, two different formats exist. One pixel (Color 1 pixel) is one word for RGB 24-bit format. Otherwise, two pixels are one word for RGB 16-bit format. Refer to next diagram.

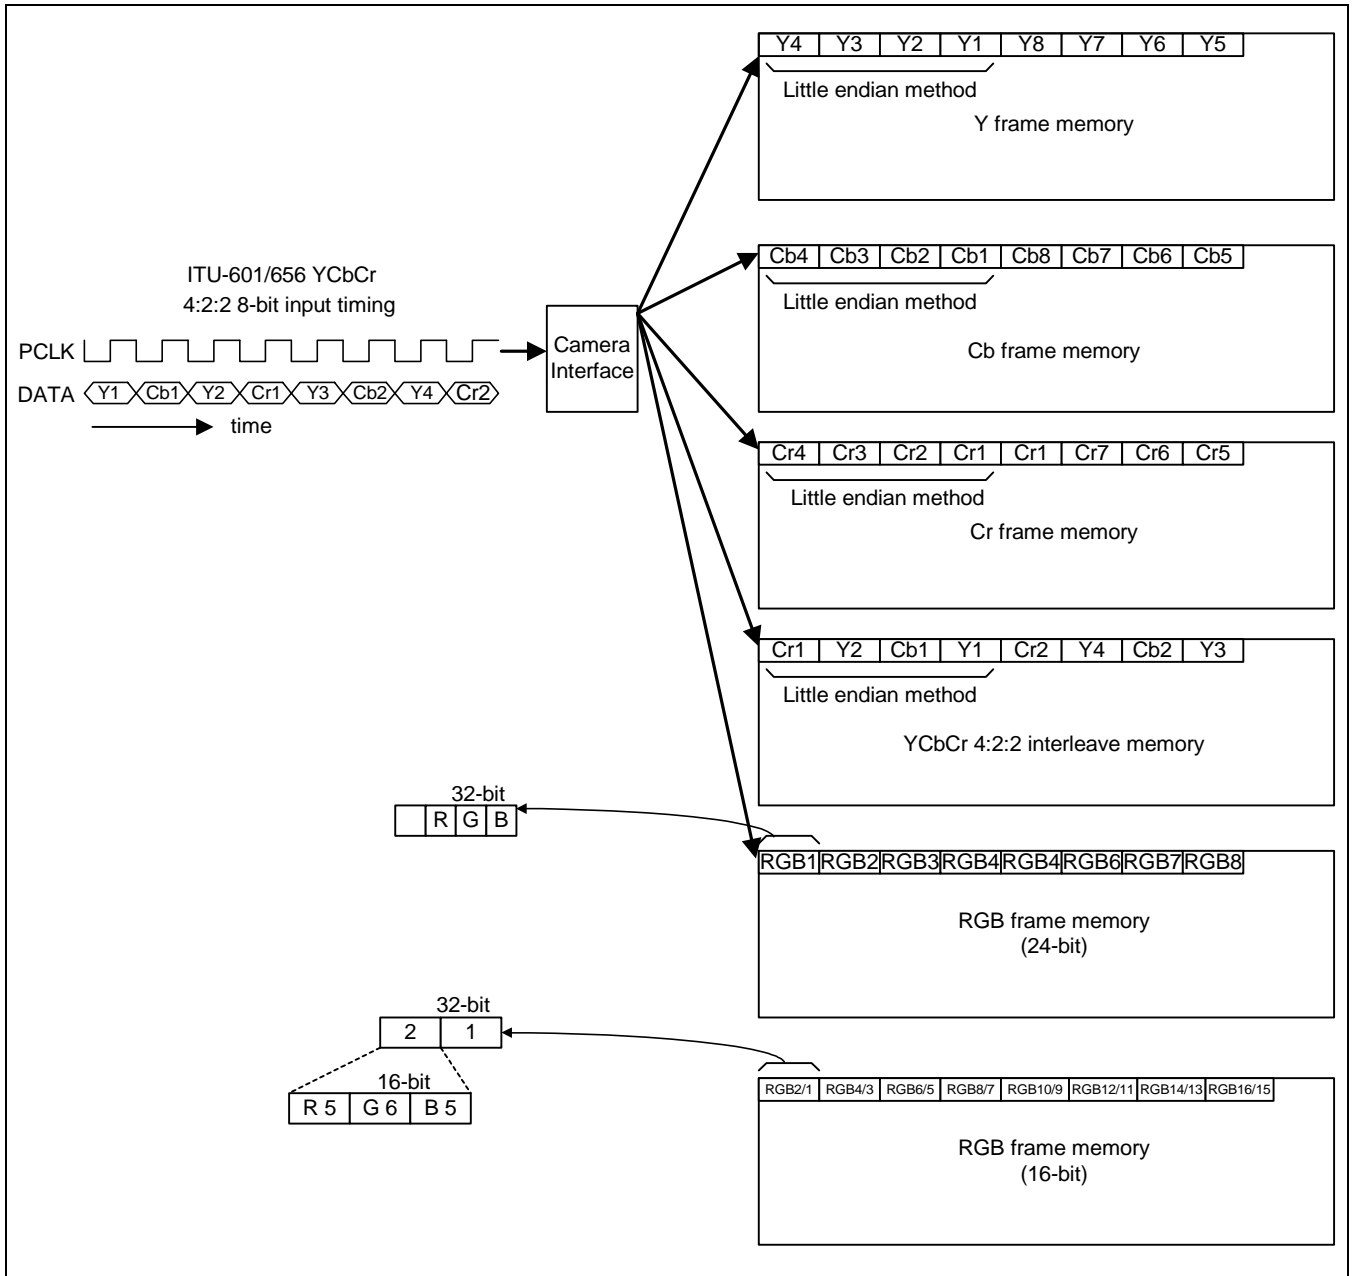

Figure 23-10. Memory Storing Style

#### 4.5 TIMING DIAGRAM FOR REGISTER SETTING

The first register setting for frame capture command can be occurred in anywhere of frame period. But, it is recommend to do first setting at the VSYNC "L" state. VSYNC information can be read from status SFR. Refer to the below figure. All command include `ImgCptEn`, is valid at VSYNC falling edge. Be sure that except first SFR setting, all command should be programmed in ISR(Interrupt Service Routine). It is not allowed for target size information to be changed during capture operation. However, image mirror or rotation, windowing, and Zoom In settings are allowed to change in capturing operation. but, In case preview path select MSDMA input mode, all command should be programmed after MSDMA and Preview DMA operation end.

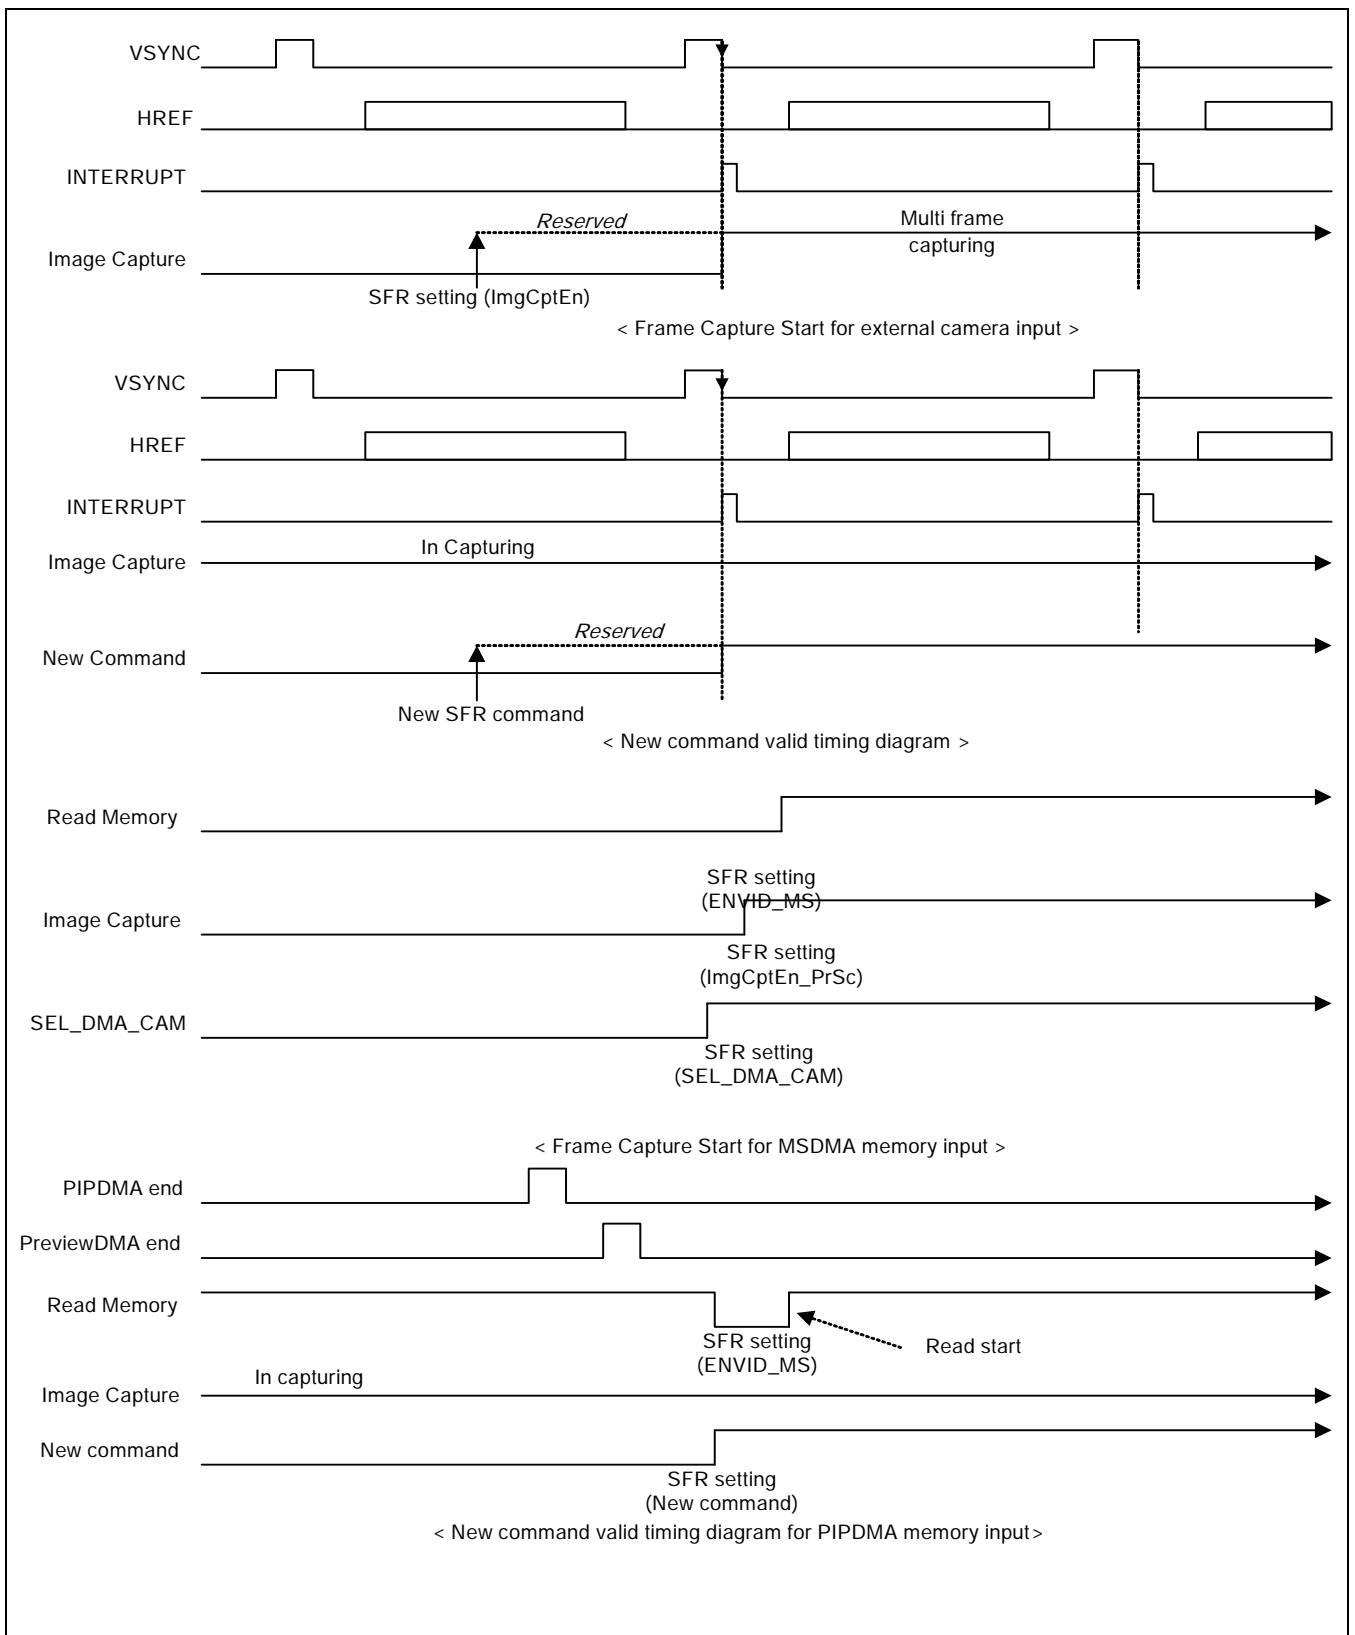

Figure 23-11. Timing Diagram for Register Setting

#### 4.5.1 Timing diagram for Last IRQ (Camera capture mode)

IRQ except LastIRQ is generated before image capturing. Last IRQ which means capture-end can be set by following timing diagram. LastIRQEn is auto-cleared and, as mentioned, SFR setting in ISR is for next frame command. So, for adequate last IRQ, you should follow next sequence between LastIRQEn and ImgCptEn/ImgCptEn\_CoSc/ImgCptEnPrSC. It is recommended that ImgCptEn/ImgCptEn\_CoSc/ImgCptEnPrSC are set at same time and at last of SFR setting in ISR. FrameCnt which is read in ISR, means next frame count. On following diagram, last captured frame count is "1". That is, Frame 1 is the last-captured frame among frame 0~3. FrameCnt is increased by 1 at IRQ rising.

- Camera input capture path (applied both Preview & Codec path)

#### 4.5.2 Timing diagram for IRQ (Memory data processing mode)

MSDMA(Memory data input path) input is applied only preview path !!! when SFR SEL\_DMA\_CAM = '1' ). Codec path doesn't care. codec path is applied a only camera capturing case. IRQ is generated after Preview DMA operation done per frame. This mode is aware of starting point by user's SFR setting (ENVID\_MS '0' → '1'). so, this mode doesn't need IRQ of starting point and LastIRQ. FrameCnt is increased by 1 at ENVID\_MS low to rising ('0' → '1') and ImgCptEn\_PrSC '1'

Figure 23-12. Timing Diagram for Last IRQ

4.6 MSDMA FEATURE

MSDMA supports memory data scaling. Camera interface has two input devices (only preview path). First is external camera. Second is Memory data. If MSDMA (reading the memory data) want to use in preview path. SFR SEL\_DMA\_CAM signal should be set '1'. This input path is called Memory Scaling DMA path.

NOTES: Only two image format support for MSDMA input. (= Saved memory format)

1. YCbCr 4:2:0
2. YCbCr 4:2:2 (Interleave)

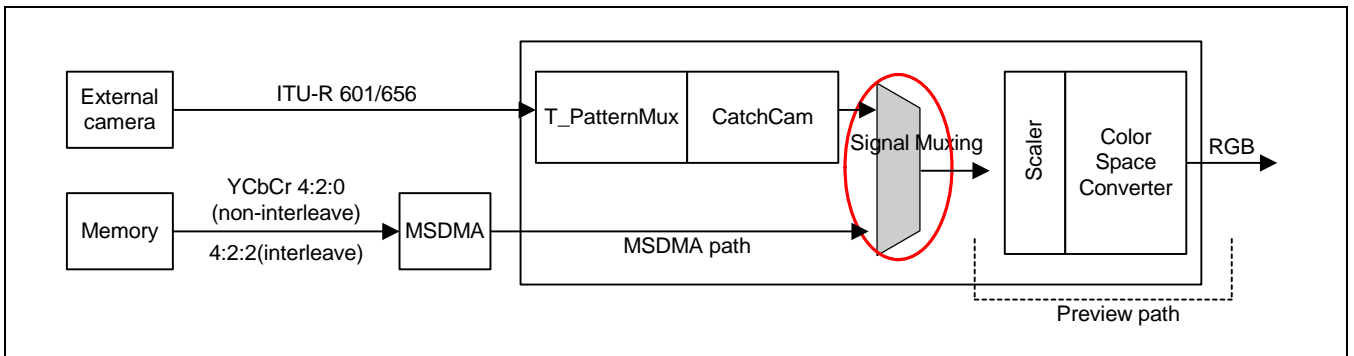

Figure 23-13. MSDMA or External Camera interface (only CAMIFpreview path)

## 5 SOFTWARE INTERFACE

CAMIF SFR (Special Function Register)

## 6 CAMERA INTERFACE SPECIAL REGISTERS

- When preview input use MSDMA path, the first column mark (v) sfr will be related to the preview operation.
- The last column means that each value can change by each VSYNC start during capture enable.  
(O : change , X : not change)

### 6.1 SOURCE FORMAT REGISTER

| Register | Address     | R/W | Description            | Reset Value |

 (WinHorOfst2 & WinVerOfst2 are assigned in the CIWDOFST2 register)

| CIWDOFST    | Bit     | Description   | Initial State | Change State |
|-------------|---------|---|---------------|--------------|
| WinOfsEn    | [31]    | 1 = window offset enable<br>0 = no offset   | 0             | O            |
| ClrOvCoFiY  | [30]    | 1 = clear the overflow indication flag of input CODEC FIFO Y<br>0 = normal  | 0             | X            |
| Reserved    | [29:27] |   | 0             | X            |
| WinHorOfst  | [26:16] | Window horizontal offset by pixel unit. (It should be 2's multiple)<br>Caution: SourceHsize-WinHorOfst- WinHorOfst2 should be 8's multiple. | 0             | O            |
| ClrOvCoFiCb | [15]    | 1 = clear the overflow indication flag of input CODEC FIFO Cb<br>0 = normal   | 0             | X            |
| ClrOvCoFiCr | [14]    | 1 = clear the overflow indication flag of input CODEC FIFO Cr<br>0 = normal   | 0             | X            |
| ClrOvPrFiCb | [13]    | 1 = clear the overflow indication flag of input PREVIEW FIFO Cb<br>0 = normal   | 0             | X            |
| ClrOvPrFiCr | [12]    | 1 = clear the overflow indication flag of input PREVIEW FIFO Cr<br>0 = normal   | 0             | X            |
| Reserved    | [11]    |   | 0             | X            |
| WinVerOfst  | [10:0]  | Window vertical offset by pixel unit  | 0             | O            |

**NOTE:** Clear bits should be set by zero after clearing the flags.

It should be as  $(WinHorOfst + WinHorOfst2) \geq (SourceHsize - 720 * PreHorRatio\_Pr)$

Crop Hsize ( = SourceHsize – WinHorOfst - WinHorOfst2) must be 4's multiple of PreHorRatio.

Crop Vsize ( = SourceVsize – WinVerOfst - WinVerOfst2) must be multiple of PreVerRatio when scale down. and must be an even number if In422\_Co = 0 and Out422\_Co = 0

< Example >

| Crop Hsize | Permitted Prescale_ratio | PreDstWidth_xx |
|------------|--------------------------|----------------|
| 8n         | 2                        | 4n             |
| 16n        | 2 or 4                   | 4n             |
| 32n        | 2, 4 or 8                | 4n             |

- Interleaved burst length

|  |            |
|--|------------|
| Y burst length                                       | 2 , 4 , 8  |
| C burst length (C burst length = Y burst length / 2) | 1 , 2 , 4  |
| Wanted burst length ( = Y + 2C )                     | 4 , 8 , 16 |

**NOTE:** When Codec output format is YCbCr 4:2:2 interleave ,ScalerBypass\_Co = 0 and ScaleUp\_V\_Co = 1 , Wanted main burst length = 16 and Wanted remained burst length ≠ 16 is not allowed.

- Non-Interleaved burst length

|   |                                 |                                     |
|---|---------------------------------|-------------------------------------|
| Y | Main burst length = 4, 8, 16    | Remained burst length = 4, 8, 16    |
| C | Main burst length = 2, 4, 8, 16 | Remained burst length = 2, 4, 8, 16 |

**NOTE:** When Interleave\_Co = 1, there are some restricts in burst length setting as below.

Burst size calculations are done to determine the wanted burst length. After finding the wanted burst length.

The SFR fields are programmed as shown below,

Y : wanted Main burst length =  $2 * Yburst1\_Co$ , and wanted Remained burst length =  $2 * Yburst2\_Co$ .

Cb/Cr : wanted Main burst length =  $Yburst1\_Co / 2 = Cburst1\_Co$ , and wanted Remained burst length =  $Yburst2\_Co / 2 = Cburst2\_Co$

Example 1. Target image size : QCIF (horizontal Y width = 176 pixels. 1 pixel = 1 Byte. 1 word = 4 pixel)

$176 / 4 = 44$  words ,  $44 \% 8 = 4 \rightarrow$  main burst = 8, remained burst = 4

If Interleave\_Co = 1 and YCbCr = 4:2:2

$176 \times (1 \text{ word} / 2 \text{ pixels}) = 88$  words ,  $88 \% 16 = 8 \rightarrow$  Wanted main burst = 16, Wanted remained burst = 8

Wanted main burst =  $16 = 2 * Yburst1 = 4 * Cburst1$ , Wanted remained burst =  $8 = 2 * Yburst2 = 4 * Cburst2$

$Yburst1\_Co = 8$ ,  $Yburst2\_Co = 4$

Example 2. Target image size : VGA (horizontal Y width = 640 pixels. 1 pixel = 1 Byte. 1 word = 4 pixel)

$640 / 8 = 80$  word ,  $160 \% 8 = 0 \rightarrow$  main burst = 8, remained burst = 8

If Interleave\_Co = 1 , RGB565 mode

$640 \times (1 \text{ word} / 2 \text{ pixel}) = 320$  words ,  $320 \% 16 = 0 \rightarrow$  Wanted main burst = 16, Wanted remained burst = 16

$Yburst1\_Co = 8$ ,  $Yburst2\_Co = 8$

If Interleave\_Co = 1 , RGB888 mode

$640 \times (1 \text{ word} / 1 \text{ pixels}) = 640$  words,  $640 \% 16 = 0 \rightarrow$  Wanted main burst = 16, Wanted remained burst = 16

$Yburst1\_Co = 8$ ,  $Yburst2\_Co = 8$

## 6.19 REGISTER SETTING GUIDE FOR CODEC SCALER AND PREVIEW SCALER

SRC\_Width and DST\_Width satisfy the word boundary constraints such that the number of horizontal pixel can be represented to  $kn$  where  $n = 1, 2, 3, \dots$  and  $k = 1 / 2 / 8$  for 24bppRGB / 16bppRGB / YCbCr420 image, respectively. TargetHsize should not be larger than SourceHsize. Similarly, TargetVsize should not be larger than SourceVsize.

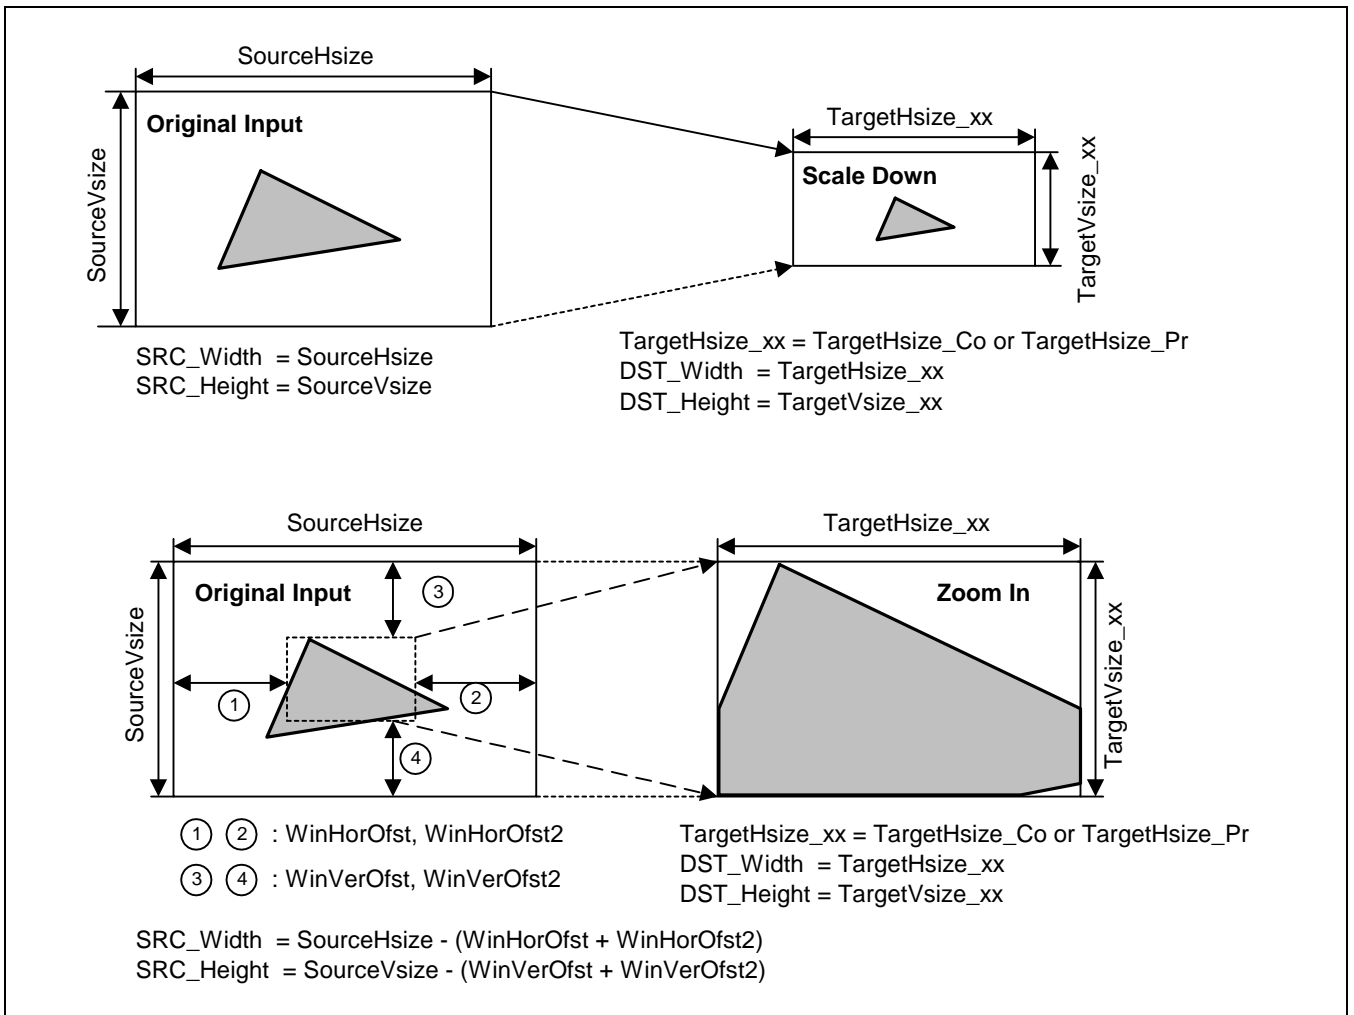

Figure 23-17. Scaling scheme

The other control registers of pre-scaled image size, pre-scale ratio, pre-scale shift ratio and main scale ratio are defined according to the following equations.

```

If ( SRC_Width >= 64 x DST_Width ) { Exit(-1); /* Out Of Horizontal Scale */ }
else if ( SRC_Width >= 32 x DST_Width ) { PreHorRatio_xx = 32; H_Shift = 5; }
else if ( SRC_Width >= 16 x DST_Width ) { PreHorRatio_xx = 16; H_Shift = 4; }
else if ( SRC_Width >= 8 x DST_Width ) { PreHorRatio_xx = 8; H_Shift = 3; }
else if ( SRC_Width >= 4 x DST_Width ) { PreHorRatio_xx = 4; H_Shift = 2; }
else if ( SRC_Width >= 2 x DST_Width ) { PreHorRatio_xx = 2; H_Shift = 1; }
else { PreHorRatio_xx = 1; H_Shift = 0; }
PreDstWidth_xx = SRC_Width / PreHorRatio_xx;
MainHorRatio_xx = ( SRC_Width << 8 ) / ( DST_Width << H_Shift);
    
```

```

If ( SRC_Height >= 64 x DST_Height ) { Exit(-1); /* Out Of Vertical Scale Range */ }
else if ( SRC_Height >= 32 x DST_Height ) { PreVerRatio_xx = 32; V_Shift = 5; }
else if ( SRC_Height >= 16 x DST_Height ) { PreVerRatio_xx = 16; V_Shift = 4; }
else if ( SRC_Height >= 8 x DST_Height ) { PreVerRatio_xx = 8; V_Shift = 3; }
else if ( SRC_Height >= 4 x DST_Height ) { PreVerRatio_xx = 4; V_Shift = 2; }
else if ( SRC_Height >= 2 x DST_Height ) { PreVerRatio_xx = 2; V_Shift = 1; }
else { PreVerRatio_xx = 1; V_Shift = 0; }
PreDstHeight_xx = SRC_Height / PreVerRatio_xx;
MainVerRatio_xx = ( SRC_Height << 8 ) / ( DST_Height << V_Shift);

SHfactor_xx = 10 - ( H_Shift + V_Shift);

```

**Caution!** In preview path, Pre-scaled H\_width must be the less than 720. (The maximum size of preview path scaler's horizontal line buffer is 720.)

Example 1. Source image horizontal size : SRC\_Width = 1280, Target image horizontal size : DST\_Width = 480  
 (SRC\_Width >= 2 x DST\_Width) -> PreHorRatio\_xx = 2  
 PreDstWidth\_xx = SRC\_Width / PreHorRatio\_xx = 1280/2 = 640  
 PreDstWidth\_xx = 640 <= 640(The maximum size of preview path scaler's horizontal line buffer)  
 Scaling is success.

Example 2. Source image horizontal size : SRC\_Width = 800, Target image horizontal size : DST\_Width = 480  
 (SRC\_Width < 2 x DST\_Width) PreHorRatio\_xx = 1  
 PreDstWidth\_xx = SRC\_Width / PreHorRatio\_xx = 800/1 = 800  
 PreDstWidth\_xx = 800 > 720(The maximum size of preview path scaler's horizontal line buffer)  
 Scaling is failed.

**Caution!** In Zoom-In case, you should check the next equation.

$$((\text{SourceHsize} - (\text{WinHorOfst} + \text{WinHorOfst2})) / \text{PreHorRatio\_Pr}) \leq 720$$

**Caution!** In preview memory data input path, you should not use Zoom-In, crop and image effect function.  
 (External camera input path use Zoom-In , crop and image effect function)

## 6.20 CODEC PRE-SCALER CONTROL REGISTER 1

| TargetVsize_Pr (v) | [12:0]  | Vertical pixel number of target image for preview DMA<br>(8's multiple)   | 0             | X            |

TargetHsize\_Pr and TargetVsize\_Pr should not be larger than SourceHsize and SourceVsize.

## 6.30 PREVIEW DMA CONTROL REGISTER

| Register | Address     | R/W | Description                 | Reset Value |
|----------|-------------|-----|-----------------------------|-------------|
| CIPRCTRL | 0x4D80_0080 | RW  | Preview DMA control related | 0           |

| CIPRCTRL         | Bit     | Description   | Initial State | Change State |
|------------------|---------|---|---------------|--------------|
| Reserved         | [31:24] |   | 0             | X            |
| RGBburst1_Pr (v) | [23:19] | Main burst length for preview RGB frames                                  | 0             | X            |
| RGBburst2_Pr (v) | [18:14] | Remained burst length for preview RGB frames                              | 0             | X            |
| Reserved         | [13:3]  |   | 0             | X            |
| LastIRQEn_Pr (v) | [2]     | 1 : enable last IRQ at the end of frame capture (One pulse)<br>0 : normal | 0             | X            |
| Reserved         | [1:0]   |   | 0             | X            |

Main burst lengths must be one of the 4,8,16 and Remained burst lengths must be one of the 2,4,8,16.

Example 1. Target image size : QCIF for RGB 32-bit format (horizontal width = 176 pixels. 1 pixel = 1 word)

176 pixel = 176 word.

$176 \% 16 = 0 \rightarrow$  main burst = 16, remained burst = 16

Example 2. Target image size : VGA for RGB 16-bit format (horizontal width = 640 pixels. 2 pixel = 1 word)

$640 / 2 = 320$  word.

$320 \% 16 = 0 \rightarrow$  main burst = 16, remained burst = 16

|---------------|---------|---|---------------|--------------|
| Reserved      | [31:12] |   | 0             | X            |
| CIMSWIDTH (v) | [11:0]  | MSDMA source image horizontal pixel size (must be 8's multiple. It must be 4's multiple of PreHorRatio. minimum 16) | 0             | X            |

**6.50.1 - MSDMA Start address**

Start address of ADDRStart\_Y/Cb/Cr points the first word address where the corresponding component of Y/Cb/Cr is read. Each one should be aligned with word boundary (i.e. ADDRStart\_X[1:0] = 00). ADDRStart\_Cb and ADDRStart\_Cr are valid only for the YCbCr420 source image format.

**6.50.2 - MSDMA End address**

1) ADDREnd\_Y

= ADDRStart\_Y + Memory size for the component of Y

= ADDRStart\_Y + (SRC\_Width × SRC\_Height) × ByteSize\_Per\_Pixel + Offset\_Y × (SRC\_Height-1)

2) ADDREnd\_Cb (Valid for YCbCr420 source format)

= ADDRStart\_Cb + Memory size for the component of Cb

= ADDRStart\_Cb + (SRC\_Width/2 × SRC\_Height/2) × ByteSize\_Per\_Pixel + Offset\_Cb × (SRC\_Height/2-1)

3) ADDREnd\_Cr (Valid for YCbCr420 source format)

= ADDRStart\_Cr + Memory size for the component of Cr

= ADDRStart\_Cr + (SRC\_Width/2 × SRC\_Height/2) × ByteSize\_Per\_Pixel + Offset\_Cr × (SRC\_Height/2-1)

**6.50.3 - MSDMA OFFSET**

1) Offset\_Y/Cb/Cr

= Memory size for offset per a horizontal line

= Number of pixel (or sample) in horizontal offset × ByteSize\_Per\_Pixel (or Sample)

Cf.) ByteSize\_Per\_Pixel =  $\left\{ \begin{array}{l} 1 \text{ for YCbCr420} \\ 2 \text{ for YCbCr422 (interleave)} \end{array} \right.$

## 6.51 MSDMA CONTROL REGISTER

| Register | Address     | R/W | Description            | Reset Value |

## ADC & TOUCH SCREEN INTERFACE

### 1 OVERVIEW

The 12-bit CMOS ADC (Analog to Digital Converter) is a recycling type device with 10-channel analog inputs. It converts the analog input signal into 12-bit binary digital codes at a maximum conversion rate of 1MSPS with 5MHz A/D converter clock. A/D converter operates with on-chip sample-and-hold function and power down (standby) mode is supported.

Touch screen interface can controls input pads (XP, XM, YP and YM) to obtain X/Y-positions on the external touch screen device. Touch Screen Interface contains three main blocks; these are touch screen pads control logic, ADC interface logic and interrupt generation logic.

#### 1.1 FEATURES

- Resolution: 10-bit / 12-bit (controllable)
- Differential Linearity Error:  $\pm 2.0$  LSB
- Integral Linearity Error:  $\pm 4.0$  LSB
- Maximum Conversion Rate: 1 MSPS
- Low Power Consumption
- Power Supply Voltage: 3.3V
- Reference Voltage (VREF): 3.3V
- On-chip Sample-and-hold Function
- Normal Conversion Mode
- Separate X/Y position conversion Mode
- Auto (Sequential) X/Y Position Conversion Mode
- Waiting for Interrupt Mode

## 2 ADC & TOUCH SCREEN INTERFACE OPERATION

### 2.1 BLOCK DIAGRAM

Figure 24-1 shows the functional block diagram of A/D converter and touch screen interface. Note that the A/D converter device is a recycling type.

Figure 24-1. ADC and Touch Screen Interface Block Diagram

## 2.2 FUNCTION DESCRIPTIONS

### 2.2.1 A/D Conversion Time

When the PCLK frequency is 50 MHz, the prescaler value is 49 and total 10-bit and 12-bit conversion time is given:

$$\text{A/D converter freq.} = 50 \text{ MHz} / (49 + 1) = 1 \text{ MHz}$$

$$\text{Conversion time} = 1 / (1 \text{ MHz} / (5 \text{ cycles})) = 1 / 200 \text{ KHz} = 5 \text{ us}$$

#### NOTE

This A/D converter is designed to operate at maximum 5 MHz clock, so the conversion rate can go up to 1MSPS.

### 2.2.2 Touch Screen Interface Modes (AIN6 ~ AIN9)

#### 1. Normal conversion mode (AUTO\_PST = 0, XY\_PST = 0)

The operation of this mode is identical with AIN0~AIN5's. It can be initialized by setting the ADC Control Register (ADCCON) and ADC touch screen control register (ADCTSC). All of the switches and pull-up resistor should be turned off (reset value 0x58 makes switches turn-off). The converted data can be read out from ADC conversion data 0 register (ADCDAT0).

#### 2. Separate X/Y position conversion mode (AUTO\_PST = 0, XY\_PST : contorl)

This mode consists of two states; one is X-position measurement state and the other is Y-position measurement state.

X-position measurement state is operated as the following way; set XY\_PST is '1' and read out the converted data (X-position) from ADCDAT0. The end of X-position conversion can be notified by interrupt (INT\_ADC).

Y-position measurement state is operated as the following way; set XY\_PST is '2' and read out the converted data (Y-position) from ADCDAT1. The end of Y-position conversion can be notified by interrupt (INT\_ADC).

| State                  | XP       | XM       | YP       | YM       |
|------------------------|----------|----------|----------|----------|
| X-position measurement | VDDA_ADC | VSSA_ADC | AIN7     | Hi-z     |
| Y-position measurement | AIN9     | Hi-z     | VDDA_ADC | VSSA_ADC |

#### 3. Auto(Sequential) X/Y position conversion mode (AUTO\_PST = 1, XY\_PST = 0)

Auto (sequential) X/Y position conversion mode is operated as the following. Touch screen controller sequentially converts X-position and Y-position that is touched. After touch screen controller converts X-position data to ADCDAT0 and then converts Y-position data to ADCDAT1, Touch screen interface generates interrupt (INT\_ADC). The measurement states are automatically changed.

**4. Waiting for interrupt mode (ADCTSC = 0xd3)**

Touch screen controller generates interrupt (INT\_TC) signal when the stylus is down. The value of ADC touch screen control register (ADCTSC) is '0xd3'; PULL\_UP is '0', XP\_SEN is '1', XM\_SEN is '0', YP\_SEN is '1' and YM\_SEN is '1'. Touch interrupt can be generated when stylus pen is down or up.

After touch screen controller generates interrupt signal (INT\_TC), waiting for interrupt mode must be cleared. (XY\_PST sets to the No operation Mode)

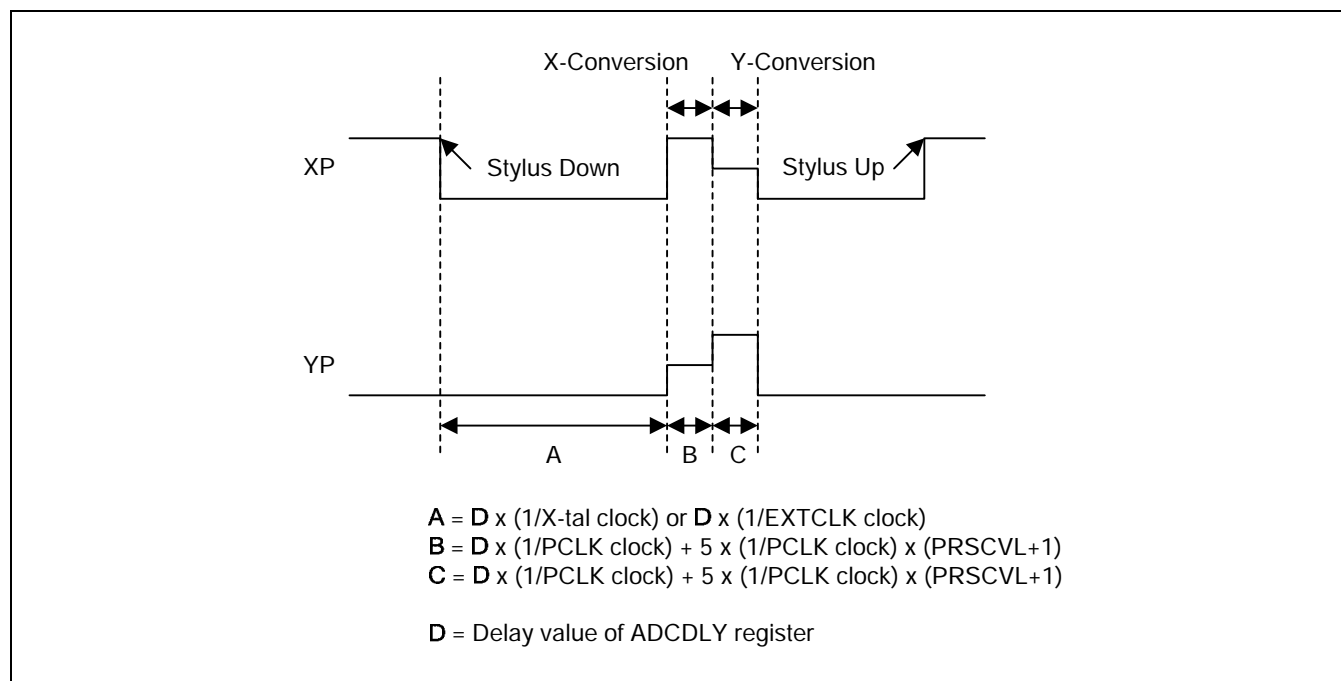

| Mode                       | XP                       | XM   | YP   | YM       |
|----------------------------|--------------------------|------|------|----------|
| Waiting for Interrupt Mode | VDDA_ADC(Pull-up enable) | Hi-z | Hi-z | VSSA_ADC |

**2.2.3 Standby Mode**

Standby mode is activated when ADCCON [2] is set to '1'. In this mode, A/D conversion operation is halted and ADCDAT0, ADCDAT1 register contains the previous converted data.

**2.2.4 Programming Notes**

1. The A/D converted data can be accessed by means of interrupt or polling method. With interrupt method, the overall conversion time - from A/D converter start to converted data read - may be delayed because of the return time of interrupt service routine and data access time. With polling method, by checking the ADCCON[15] - end of conversion flag-bit, the read time from ADCDAT register can be determined.
2. A/D conversion can be activated in different way: After ADCCON[1] - A/D conversion start-by-read mode-is set to 1, A/D conversion starts simultaneously whenever converted data is read.

**Figure 24-2. Timing Diagram in Auto (Sequential) X/Y Position Conversion Mode**

### 3 ADC AND TOUCH SCREEN INTERFACE SPECIAL REGISTERS

#### 3.1 ADC CONTROL (ADCCON) REGISTER

| Register | Address    | R/W | Description          | Reset Value |
|----------|------------|-----|----------------------|-------------|
| ADCCON   | 0x58000000 | R/W | ADC control register | 0x3FC4      |

| ADCCON       | Bit    | Description   | Initial State |
|--------------|--------|---|---------------|
| ECFLG        | [15]   | End of conversion flag (read only).<br>0 = A/D conversion in process<br>1 = End of A/D conversion   | 0             |
| PRSCEN       | [14]   | A/D converter prescaler enable.<br>0 = Disable<br>1 = Enable  | 0             |
| PRSCVL       | [13:6] | A/D converter prescaler value.<br>Data value: 5 ~ 255<br>Note that division factor is (N+1) when the prescaler value is N.<br><b>Note:</b> ADC frequency should be set less than PCLK by 5 times.<br>(Ex. PCLK = 10MHz, ADC Frequency < 2MHz) | 0xFF          |
| Reserved     | [5:4]  | Reserved  | 0             |
| RESSEL       | [3]    | A/D converter resolution selection<br>0 = 10-bit resolution<br>1 = 12-bit resolution  | 0             |
| STDBM        | [2]    | Standby mode select.<br>0 = Normal operation mode<br>1 = Standby mode   | 1             |
| READ_START   | [1]    | A/D conversion starts by read.<br>0 = Disable start by read operation<br>1 = Enable start by read operation   | 0             |
| ENABLE_START | [0]    | A/D conversion starts by setting this bit.<br>If READ_START is enabled, this value is not valid.<br>0 = No operation<br>1 = A/D conversion starts and this bit is cleared after the start-up.   | 0             |

## 3.2 ADC TOUCH SCREEN CONTROL (ADCTSC) REGISTER

| Register | Address    | R/W | Description                       | Reset Value |
|----------|------------|-----|-----------------------------------|-------------|
| ADCTSC   | 0x58000004 | R/W | ADC touch screen control register | 0x058       |

| ADCTSC   | Bit   | Description  | Initial State |
|----------|-------|--|---------------|
| UD_SEN   | [8]   | Select interrupt source Stylus Up or Down<br>0 = Detect Stylus Down Signal.<br>1 = Detect Stylus Up Signal.  | 0             |
| YM_SEN   | [7]   | YM to GND Switch Enable<br>0 = Switch disable.(YM = AIN6, Hi-z)<br>1 = Switch enable.(YM = VSSA_ADC)   | 0             |
| YP_SEN   | [6]   | YP to VDD Switch Enable<br>0 = Switch enable.(YP = VDDA_ADC)<br>1 = Switch disable.(YP = AIN7, Hi-z)   | 1             |
| XM_SEN   | [5]   | XM to GND Switch Enable<br>0 = Switch disable.(XM = AIN8, Hi-z)<br>1 = Switch enable.(XM = VSSA_ADC)   | 0             |
| XP_SEN   | [4]   | XP to VDD Switch Enable<br>0 = Switch enable.(XP = VDDA_ADC)<br>1 = Switch disable.(XP = AIN9, Hi-z)   | 1             |
| PULL_UP  | [3]   | XP Pull-up Switch Enable<br>0 = XP pull-up enable.<br>1 = XP pull-up disable.  | 1             |
| AUTO_PST | [2]   | Automatically sequencing conversion of X-Position and Y-Position<br>0 = Normal ADC conversion.<br>1 = Auto measurement of X-position, Y-position.                            | 0             |
| XY_PST   | [1:0] | Manually measurement of X-Position or Y-Position.<br>00 = No operation mode<br>01 = X-position measurement<br>10 = Y-position measurement<br>11 = Waiting for Interrupt Mode | 0             |

**NOTES:**

1. While waiting for Touch screen Interrupt, XP\_SEN bit should be set to '1'(XP Output disable) and PULL\_UP bit should be set to '0'(XP Pull-up enable).
2. AUTO\_PST bit should be set '1' only in Automatic (Sequential) X/Y Position conversion.
3. PULL\_UP switche should be eabled during stop/sleep mode to avoid leakage current.

## 3.3 ADC START DELAY (ADCDLY) REGISTER

| Register | Address    | R/W | Description                          | Reset Value |
|----------|------------|-----|--------------------------------------|-------------|
| ADCDLY   | 0x58000008 | R/W | ADC start or interval delay register | 0x00ff      |

| ADCDLY | Bit    | Description  | Initial State |
|--------|--------|--|---------------|
| DELAY  | [15:0] | <p>In case of ADC conversion mode (Normal, Separate, Auto conversion);<br/>ADC conversion is delayed by counting this value. Counting clock is PCLK.</p> <p>In case of waiting for interrupt mode;<br/>When stylus down occurs in waiting for interrupt mode, counts this value and then generates Interrupt signal (INT_TC) for filtering noise. Counting clock is external input clock (X-tal or EXTCLK).</p> <p><b>Note:</b> Do not use zero value (0x0000)</p> | 0x00ff        |

## 3.4 ADC CONVERSION DATA (ADCDAT0) REGISTER

| Register | Address    | R/W | Description                  | Reset Value |
|----------|------------|-----|------------------------------|-------------|
| ADCDAT0  | 0x5800000C | R   | ADC conversion data register | -           |

| ADCDAT0                   | Bit     | Description  | Initial State |
|---------------------------|---------|--|---------------|
| UPDOWN                    | [15]    | Up or down state of Stylus at Waiting for Interrupt Mode.<br>0 = Stylus down state<br>1 = Stylus up state  | -             |

| XPDATA<br>(Normal ADC)    | [9:0]   | X-position conversion data value. (include Normal ADC conversion data value)<br>Data value(data [9:0]) = 0 ~ 0x3FF   | -             |

## 3.5 ADC CONVERSION DATA (ADCDAT1) REGISTER

| Register | Address    | R/W | Description                  | Reset Value |
|----------|------------|-----|------------------------------|-------------|
| ADCDAT1  | 0x58000010 | R   | ADC conversion data register | -           |

| ADCDAT1   | Bit     | Description  | Initial State |
|-----------|---------|--|---------------|
| UPDOWN    | [15]    | Up or down state of Stylus at Waiting for Interrupt Mode.<br>0 = Stylus down state<br>1 = Stylus up state  | -             |
| AUTO_PST  | [14]    | Automatic sequencing conversion of X-position and Y-position. (mirroring AUTO_PST in ADCTSC register)<br>0 = Normal ADC conversion<br>1 = Auto measurement of X-position, Y-position                             | -             |
| XY_PST    | [13:12] | Manual measurement of X-position or Y-position. (mirroring XY_PST in ADCTSC register)<br>00 = No operation mode<br>01 = X-position measurement<br>10 = Y-position measurement<br>11 = Waiting for Interrupt Mode | -             |
| Ypdata_12 | [11:10] | When A/D resolution is 12bit, X-position conversion MSB 2-bit data value.<br>Data value(data [11:0]) = 0 ~ 0xFFF   |               |
| Ypdata    | [9:0]   | Y-position conversion data value.<br>Data value(data [9:0]) = 0 ~ 0x3FF  | -             |

## 3.6 ADC TOUCH SCREEN UP-DOWN INT CHECK REGISTER (ADCUPDN)

| Register | Address    | R/W | Description                               | Reset Value |
|----------|------------|-----|---|-------------|
| ADCUPDN  | 0x58000014 | R/W | Stylus Up or Down Interrpt state register | 0x0         |

| ADCUPDN | Bit | Description  | Initial State |
|---------|-----|--|---------------|
| TSC_UP  | [1] | Stylus Up Interrupt history. (After check, this bit should be cleared manually)<br>0 = No stylus up state.<br>1 = Stylus up interrupt has been occurred.       | 0             |
| TSC_DN  | [0] | Stylus Down Interrupt history. (After check, this bit should be cleared manually)<br>0 = No stylus down state.<br>1 = Stylus down interrupt has been occurred. | 0             |

**3.7 ADC CHANNEL MUX REGISTER (ADCMUX)**

| Register | Address   | R/W | Description                 | Reset Value |
|----------|-----------|-----|-----------------------------|-------------|
| ADCMUX   | 0x5800018 | R/W | Analog input channel select | 0x0         |

| ADCMUX | Bit   | Description  | Initial State |
|--------|-------|--|---------------|
| ADCMUX | [3:0] | Analog input channel select.<br>0000 = AIN 0<br>0001 = AIN 1<br>0010 = AIN 2<br>0011 = AIN 3<br>0100 = AIN 4<br>0101 = AIN 5<br>0110 = AIN 6 (YM)<br>0111 = AIN 7 (YP)<br>1000 = AIN8 (XM)<br>1001 = AIN9 (XP) | 0             |

**NOTE:** When Touch Screen Pads(YM, YP, XM, XP) are disabled, these ports can be used as Analog input ports(AIN6, AIN7, AIN8, AIN9) for ADC.

# 25

## IIS-BUS INTERFACE

### 1 OVERVIEW

IIS (Inter-IC Sound) is one of the popular digital audio interface. The bus has only to handle audio data, while the other signals, such as sub-coding and control, are transferred separately. Surely, it is possible to transmit data between two IIS bus. To minimize the number of pins required and to keep wiring simple, basically, a 3-line serial bus is used consisting of a line for two time-multiplexed data channels, a word select line and a clock line.

IIS interface transmits or receives sound data from external stereo audio codec. For transmitting and receiving data, two 32x16 FIFOs (First-In-First-Out) data structures are included and DMA transfer mode for transmitting or receiving samples can be supported. IIS-specific clock can be supplied from internal system clock controller through IIS clock divider or direct clock source.

### 2 FEATURE

- 2-ch IIS-bus for audio interface with DMA-based operation
- Serial, 8/16/24 bit per channel data transfers
- Supports IIS, MSB-justified and LSB-justified data format
- 32-bit width 16depth Tx FIFO, 32-bit width 16depth Rx FIFO

### 3 SIGNALS

| Name       | Direction    | Description                                     |
|------------|--------------|---|
| I2S1_LRCLK | Input/Output | IIS-Bus Audio channel select(word select) clock |
| I2S1_SCLK  | Input/Output | IIS-Bus Audio serial clock(bit clock)           |
| I2S1_CDCLK | Input/Output | IIS-Bus Audio Codec clock                       |
| I2S1_SDI   | Input        | IIS-Bus Audio serial data input                 |
| I2S1_SDO   | Output       | IIS-Bus Audio serial data output                |

## 4 BLOCK DIAGRAM

Figure 25-1. IIS-Bus Block Diagram

## 5 FUNCTIONAL DESCRIPTIONS

IIS interface consists of register bank, FIFOs, shift registers, clock control, DMA finite state machine, and channel control block as shown in Figure 25-1. Note that each FIFO has 32-bit width and 16 depth structure, which contains left/right channel data. So, FIFO access and data transfer are handled with left/right pair unit. Figure 25-1 shows the internal functional block diagram of IIS interface, for actual GPIO pad name, please refer prior page's SIGNALS table. For more detail guide of GPIO setting, please refer the GPIO chapter.

5.1 MASTER/SLAVE MODE

Master or slave mode can be chosen by setting IMS bit of IISMOD register. In master mode, I2SSCLK and I2SLRCLK are generated internally and supplied to external device. Therefore a root clock is needed for generating I2SSCLK and I2SLRzCLK by dividing. The IIS pre-scaler (clock divider) is employed for generating a root clock with divided frequency from internal system clock(PCLK, divided EPLL clock , EPLLrefCLK) and external I2S clock(from I2SCDCLK pad). The I2SSCLK and I2SLRCLK are supplied from the pin (GPIOs) in slave mode.

Master/Slave mode is different with TX/RX. Master/Slave mode presents the direction of I2SLRCLK and I2SSCLK. It doesn't matter the direction of I2SCDCLK (This is only auxiliary.). At slave mode, I2SCDCLK can be also going out for external IIS codec chip operation. If IIS bus interface transmits clock signals to IIS codec, IIS bus is master mode. But if IIS bus interface receives clock signal from IIS codec, IIS bus is slave mode. TX/RX mode indicates the direction of data flow. If IIS bus interface transmits data to IIS codec, this is TX mode. Conversely, IIS bus interface receives data from IIS codec that is RX mode. Let's distinguish Master/Slave mode from TX/RX mode.

Figure 25-2 shows the route of the root clock with internal master(PCLK, divided EPLL clock , EPLLRefClock) or external master(External I2S clock) mode setting in IIS clock control block and system controller. Note that RCLK indicates root clock and this clock can be supplied to external IIS codec chip at internal master mode and slave mode.(when CDCLKCON bit of IISMOD register is 1) At slave mode RCLK doesn't affect to I2SSCLK and I2SLRCLK, but for correct I2S functioning setting RFS, BFS are needed.

Figure 25-2. IIS Clock Control Block Diagram

### 5.1.1 DMA Transfer

In the DMA transfer mode, the transmitter or receiver FIFO are accessible by DMA controller. DMA service request is activated internally by the transmitter or receiver FIFO state. The FTXEMPT, FRXEMPT, FTXFULL, and FRXFULL bits of I2SCON register represent the transmitter or receiver FIFO data state. Especially, FTXEMPT and FRXFULL bit are the ready flag for DMA service request; the transmit DMA service request is activated when TXFIFO is not empty and the receiver DMA service request is activated when RXFIFO is not full.

The DMA transfer uses only handshaking method for single data. Note that during DMA acknowledge activation, the data read or write operation should be performed.

\* DMA request point

- TX mode : ( FIFO is not full ) & ( TXDMACTIVE is active )
- RX mode : ( FIFO is not empty ) & ( RXDMACTIVE is active )

**NOTE:** It only supports single transfer in DMA mode.

## 6 AUDIO SERIAL DATA FORMAT

### 6.1 IIS-BUS FORMAT

The IIS bus has four lines including serial data input I2SSDI, serial data output I2SSDO, left/right channel select clock I2SLRCLK, and serial bit clock I2SSCLK; the device generating I2SLRCLK and I2SSCLK is the master.

Serial data is transmitted in 2's complement with the MSB first with a fixed position, whereas the position of the LSB depends on the word length. The transmitter sends the MSB of the next word at one clock period after the I2SLRCLK is changed. Serial data sent by the transmitter may be synchronized with either the trailing or the leading edge of the clock signal. However, the serial data must be latched into the receiver on the leading edge of the serial clock signal, and so there are some restrictions when transmitting data that is synchronized with the leading edge.

The LR channel select line indicates the channel being transmitted. I2SLRCLK may be changed either on a trailing or leading edge of the serial clock, but it does not need to be symmetrical. In the slave, this signal is latched on the leading edge of the clock signal. The I2SLRCLK line changes one clock period before the MSB is transmitted. This allows the slave transmitter to derive synchronous timing of the serial data that will be set up for transmission. Furthermore, it enables the receiver to store the previous word and clear the input for the next word.

### 6.2 MSB (LEFT) JUSTIFIED

MSB-Justified (Left-Justified) format is similar to IIS bus format, except that in MSB-justified format, the transmitter always sends the MSB of the next word at the same time whenever the I2SLRCLK is changed.

### 6.3 LSB (RIGHT) JUSTIFIED

LSB-Justified (Right-Justified) format is opposite to the MSB-justified format. In other word, the transferring serial data is aligned with ending point of I2SLRCLK transition.

Figure 25-3 shows the audio serial format of IIS, MSB-justified, and LSB-justified. Note that in this figure, the word length is 16 bit and I2SLRCLK makes transition every 24 cycle of I2SSCLK (BFS is 48 fs, where fs is sampling frequency; I2SLRCLK frequency).

Figure 25-3. IIS Audio Serial Data Formats

## 6.4 SAMPLING FREQUENCY AND MASTER CLOCK

Master clock frequency (RCLK) can be selected by sampling frequency as shown in Table 25-1. Because RCLK is made by IIS pre-scaler, the pre-scaler value and RCLK type (256fs or 384fs or 512fs or 768fs) should be determined properly.

**Table 25-1. CODEC clock (CODECLK = 256fs, 384fs, 512fs, 768fs)**

| IISLRCK (fs)  | 8.000 kHz | 11.025 kHz | 16.000 kHz | 22.050 kHz | 32.000 kHz | 44.100 kHz | 48.000 kHz | 64.000 kHz | 88.200 kHz | 96.000 kHz |
|---------------|-----------|------------|------------|------------|------------|------------|------------|------------|------------|------------|
| CODECLK (MHz) | 256fs     |            |            |            |            |            |            |            |            |            |
|               | 2.0480    | 2.8224     | 4.0960     | 5.6448     | 8.1920     | 11.2896    | 12.2880    | 16.3840    | 22.5792    | 24.5760    |
|               | 384fs     |            |            |            |            |            |            |            |            |            |
|               | 3.0720    | 4.2336     | 6.1440     | 8.4672     | 12.2880    | 16.9344    | 18.4320    | 24.5760    | 33.8688    | 36.8640    |
|               | 512fs     |            |            |            |            |            |            |            |            |            |
|               | 4.0960    | 5.6448     | 8.1920     | 11.2900    | 16.3840    | 22.5790    | 24.5760    | 32.7680    | 45.1580    | 49.1520    |
|               | 768fs     |            |            |            |            |            |            |            |            |            |
| 6.1440        | 8.4672    | 12.2880    | 16.9340    | 24.5760    | 33.8690    | 36.8640    | 49.1520    | -          | -          |            |

**NOTE:** fs represents sampling frequency.

CODECLK Frequency = fs \* (256 or 384 or 512 or 768)

## 6.5 IIS CLOCK MAPPING TABLE

On selecting BFS, RFS, and BLC bits of I2SMOD register, user should refer to the following table. Table 25-2 shows the allowable clock frequency mapping relations.

**Table 25-2. IIS Clock Mapping Table**

| Clock Frequency |             | RFS   |              |              |              |
|-----------------|-------------|---|--------------|--------------|--------------|
|                 |             | 256 fs (00B)  | 512 fs (01B) | 384 fs (10B) | 768 fs (11B) |
| BFS             | 16 fs (10B) | (a)   | (a)          | (a)          | (a)          |
|                 | 24 fs (11B) | -   | -            | (a)          | (a)          |
|                 | 32 fs (00B) | (a) (b)   | (a) (b)      | (a) (b)      | (a) (b)      |
|                 | 48 fs (01B) | -   | -            | (a) (b) (c)  | (a) (b) (c)  |
| Descriptions    |             | (a) Allowed when BLC is 8-bit (01B)<br>(b) Allowed when BLC is 16-bit (00B)<br>(c) Allowed when BLC is 24-bit (10B) |              |              |              |

**NOTE:** Bit Clock Frequency  $\geq$  fs \* (bit length \* 2). Under this condition Bit Clock Frequency can be one of among fs \* (16 or 24 or 32 or 48). The codec clock is a multiple of the bit clock among fs \* (256 or 384 or 512 or 768)

**Example :** If bit length is 16 bit, Bit Clock Frequency  $\geq$  fs \* 32. So it can be one of fs \* (32 or 48).  
If Bit Clock Frequency is 48 fs, then 384fs(48 fs\* 8) and 768fs(48 fs \* 16) are the clock which is a multiple of the Bit Clock Frequency.

## 7 PROGRAMMING GUIDE

The IIS bus interface can be accessed either by the processor using programmed I/O instructions or by the DMA controller.

### 7.1 INITIALIZATION

1. Before you use IIS bus interface, you have to configure GPIOs to IIS mode. And check signal's direction. I2SLRCLK, I2SSCLK and I2SCDCLK is inout-type. The each of I2SSDI and I2SSDO is input and output.
2. Now then, you choose clock source. S3C2451 has four clock sources. Those are PCLK, divided EPLL clock EPLLRefCLK and external codec. If you want to know more detail, refer Figure 25-2.

### 7.2 PLAY MODE (TX MODE) WITH DMA

1. TXFIFO is flushed before operation. If you don't distinguish Master/Slave mode from TX/RX mode, you must study Master/Slave mode and TX/RX mode. Refer Master/Slave chapter.
2. To configure I2SMOD register and I2SPSR (IIS pre-scaler register) properly.
3. To operate system in stability, the internal TXFIFO should be almost full before transmission. First of all, DMA starts because of that reason.
4. Basically, IIS bus doesn't support the interrupt. So, you can only check state by polling through accessing SFR.
5. If TXFIFO is full, now then you make I2SACTIVE be asserted.

### 7.3 RECORDING MODE (RX MODE) WITH DMA

1. RXFIFO is flushed before operation. Also, if you don't distinguish between Master/Slave mode and TX/RX mode, you must study Master/Slave mode and TX/RX mode. Refer Master/Slave chapter.
2. To configure I2SMOD register and I2SPSR (IIS pre-scaler register) properly.
3. To operate system in stability, the internal RXFIFO should have at least one data before DMA operation. Because of that reason, you make I2SACTIVE be asserted.
4. Now then you check RXFIFO state by polling through accessing SFR.
5. If RXFIFO is not empty, let's start RXDMACTIVE.

## 7.4 EXAMPLE CODE

### TX CHANNEL

The I2S TX channel provides a single stereo compliant output. The transmit channel can operate in master or Slave mode. Data is transferred between the processor and the I2S controller via an APB access or a DMA access.

The processor must write words in multiples of two (i.e. for left and right audio sample). The words are serially shifted out timed with respect to the audio serial bitclk, SCLK and word select clock, LRCLK.

TX Channel has 16X32 bit wide FIFO where the processor or DMA can write upto 16 left/right data samples After enabling the channel for transmission.

An Example sequence is as the following.

Ensure the PCLK and CLKAUDIO are coming correctly to the I2S controller and FLUSH the TX FIFO using the TFLUSH bit in the Please ensure that I2S Controller is configured in one of the following modes.

- TX only mode
- TX/RX simultaneous mode

This can be done by programming the TXR bit in the I2SMOD Register (I2S Mode Register).

1. Then Program the following parameters according to the need

- IMS
- SDF
- BFS
- BLC
- LRP

For Programming, the above-mentioned fields please refer I2SMOD Register (I2S Mode Register).

2. Once ensured that the input clocks for I2S controller are up and running and step 1 and 2 have been completed we can write to TX FIFO.

The write to the TX FIFO has to be carried out thorough the I2STXD Register (I2S TX FIFO Register)

This 32 bit data will occupy position 0 of the FIFO and any further data will be written to position 2, 3 and so on.

The Data is aligned in the TX FIFO for 8-bits/channel or 16-bits/channel BLC as shown

Figure 25-4. TX FIFO Structure for BLC = 00 or BLC = 01

The Data is aligned in the TX FIFO for 24-bits/channel BLC as shown

**Figure 25-5. TX FIFO Structure for BLC = 10 (24-bits/channel)**

Once the data is written to the TX FIFO the TX channel can be made active by enabling the I2SACTIVE bit in the I2SCON Register (I2S Control Register).

The data is then serially shifted out with respect to the bit clock SCLK and word select clock LRCLK.

The TXCHPAUSE in the I2SCON Register (I2S Control Register) can stop the serial data transmission on the I2SSDO. The transmission is stopped once the current Left/Right channel is transmitted.

If the control registers in the I2SCON Register (I2S Control Register) and I2SMOD Register (I2S Mode Register) are to be reprogrammed then it is advisable to disable the TX channel.

If the TX channel is enabled while the FIFO is empty, no samples are read from the FIFO.

The Status of TX FIFO can be checked by checking the bits in the I2SFIC Register (I2S FIFO Control Register).

## RX CHANNEL

The I2S RX channel provides a single stereo compliant output. The receive channel can operate in master or slave mode. Data is received from the input line and transferred into the RX FIFO. The processor can then read this data via an APB read or a DMA access can access this data.

RX Channel has a 16X32 bit wide RX FIFO where the processor or DMA can read upto 16 left/right data samples after enabling the channel for reception.

An Example sequence is as following.

Ensure the PCLK and CLKAUDIO are coming correctly to the I2S controller and FLUSH the RX FIFO using the RFLUSH bit in the I2SFIC Register (I2S FIFO Control Register) and the I2S controller is configured in any of the modes

- Receive only.
- Receive/Transmit simultaneous mode

This can be done by Programming the TXR bit in the I2SMOD Register (I2S Mode Register)

1. Then Program the following parameters according to the need
  - IMS
  - SDF
  - BFS
  - BLC
  - LRP

For Programming, the above mentioned fields please refer I2SMOD Register (I2S Mode Register)

2. Once ensured that the input clocks for I2S controller are up and running and step 1 and 2 have been completed user must put the I2SACTIVE high to enable any reception of data, the I2S Controller receives data on the LRCLK change.

The Data must be read from the RX FIFO using the I2SRXD Register (I2S RX FIFO Register) only after looking at the RX FIFO count in the I2SFIC Register (I2S FIFO Control Register). The count would only increment once the complete left channel and right have been received.

The Data is aligned in the RX FIFO for 8-bits/channel or 16-bits/channel BLC as shown

Figure 25-6. RX FIFO Structure for BLC = 00 or BLC = 01

The Data is aligned in the RX FIFO for 24-bits/channel BLC as shown

Figure 25-7. RX FIFO Structure for BLC = 10 (24-bits/channel)

The RXCHPAUSE in the I2SCON register can stop the serial data reception on the I2SSDI. The reception is stopped once the current Left/Right channel is received. If the control registers in the I2SCON Register (I2S Control Register) and I2SMOD Register (I2S Mode Register) are to be reprogrammed then it is advisable to disable the RX channel.

The Status of RX FIFO can be checked by checking the bits in the I2SFIC Register (I2S FIFO Control Register).

## 8 IIS-BUS INTERFACE SPECIAL REGISTERS

Table 25-3. Register Summary of IIS Interface

| Register | Address    | R/W | Description                                  | Reset Value |
|----------|------------|-----|--|-------------|
| IISCON   | 0x55000100 | R/W | IIS interface control register               | 0x600       |
| IISMOD   | 0x55000104 | R/W | IIS interface mode register                  | 0x0         |
| IISFIC   | 0x55000108 | R/W | IIS interface FIFO control register          | 0x0         |
| IISPSR   | 0x5500010C | R/W | IIS interface clock divider control register | 0x0         |
| IISTXD   | 0x55000110 | W   | IIS interface transmit data register         | 0x0         |
| IISRXD   | 0x55000114 | R   | IIS interface receive data register          | 0x0         |

**NOTE:** All registers of IIS interface are accessible by word unit with STR/LDR instructions.

## 8.1 IIS CONTROL REGISTER (IISCON)

| Register | Address    | Description                    | Reset Value |
|----------|------------|--------------------------------|-------------|
| IISCON   | 0x55000100 | IIS interface control register | 0x0000_0600 |

| IISCON      | Bit     | R/W | Description   |
|-------------|---------|-----|---|
|             | [31:18] | R/W | Reserved. Program to zero.  |
| FTXURSTATUS | [17]    | R/W | TX FIFO under-run interrupt status. And this is used by interrupt clear bit. When this is high, you can do interrupt clear by writing '1'.<br>0 = Interrupt didn't be occurred.<br>1 = Interrupt was occurred.  |
| FTXURINTEN  | [16]    | R/W | TX FIFO Under-run Interrupt Enable<br>0 = TXFIFO Under-run INT disable<br>1 = TXFIFO Under-run INT enable1)   |
|             | [15:12] | R/W | Reserved. Program to zero.  |
| LRI         | [11]    | R   | Left/Right channel clock indication. Note that LRI meaning is dependent on the value of LRP bit of I2SMOD register.<br>0 = Left (when LRP bit is low) or right (when LRP bit is high)<br>1 = Right (when LRP bit is low) or left (when LRP bit is high) |
| FTXEMPT     | [10]    | R   | Tx FIFO empty status indication.<br>0 = FIFO is not empty (ready for transmit data to channel)<br>1 = FIFO is empty (not ready for transmit data to channel)  |
| FRXEMPT     | [9]     | R   | Rx FIFO empty status indication.<br>0 = FIFO is not empty<br>1 = FIFO is empty  |
| FTXFULL     | [8]     | R   | Tx FIFO full status indication.<br>0 = FIFO is not full<br>1 = FIFO is full   |
| FRXFULL     | [7]     | R   | Rx FIFO full status indication.<br>0 = FIFO is not full (ready for receive data from channel)<br>1 = FIFO is full (not ready for receive data from channel)   |
| TXDMAPAUSE  | [6]     | R/W | Tx DMA operation pause command. Note that when this bit is activated at any time, the DMA request will be halted after current on-going DMA transfer is completed.<br>0 = No pause DMA operation<br>1 = Pause DMA operation                             |

| IISCON     | Bit | R/W | Description  |
|------------|-----|-----|--|
| RXDMPAUSE  | [5] | R/W | Rx DMA operation pause command. Note that when this bit is activated at any time, the DMA request will be halted after current on-going DMA transfer is completed.<br>0 = No pause DMA operation<br>1 = Pause DMA operation      |
| TXCHPAUSE  | [4] | R/W | Tx channel operation pause command. Note that when this bit is activated at any time, the channel operation will be halted after left-right channel data transfer is completed.<br>0 = No pause operation<br>1 = Pause operation |
| RXCHPAUSE  | [3] | R/W | Rx channel operation pause command. Note that when this bit is activated at any time, the channel operation will be halted after left-right channel data transfer is completed.<br>0 = No pause operation<br>1 = Pause operation |
| TXDMACTIVE | [2] | R/W | Tx DMA active (start DMA request). Note that when this bit is set from high to low, the DMA operation will be forced to stop immediately.<br>0 = Inactive<br>1 = Active  |
| RXDMACTIVE | [1] | R/W | Rx DMA active (start DMA request). Note that when this bit is set from high to low, the DMA operation will be forced to stop immediately.<br>0 = Inactive<br>1 = Active  |
| I2SACTIVE  | [0] | R/W | IIS interface active (start operation).<br>0 = Inactive<br>1 = Active  |

**NOTE:** When playing is finished, overrun interrupt will be occur. (Since no more data are written into TXFIFO at the end of playing.) User can stop transmission at this overrun interrupt.

## 8.2 IIS MODE REGISTER (IISMOD)

| Register | Address    | Description                 | Reset Value |
|----------|------------|-----------------------------|-------------|
| IISMOD   | 0x55000104 | IIS interface mode register | 0x0000_0000 |

| IISMOD   | Bit     | R/W | Description  |
|----------|---------|-----|--|
|          | [31:15] | R/W | Reserved. Program to zero.   |
| BLC      | [14:13] | R/W | Bit Length Control Bit Which decides transmission of 8/16 bits per audio channel<br>00 = 16 Bits per channel<br>01 = 8 Bits Per Channel<br>10 = 24 Bits Per Channel<br>11 = Reserved   |
| CDCLKCON | [12]    | R/W | Determine direction of codec clock(I2SCDCLK)<br>0 = Supply codec clock to external codec chip.<br>(from PCLK, EPLL, EPLLRefCLK)<br>1 = Get codec clock from external codec chip. (to CLKAUDIO)<br>(Refer to Figure 25-2)   |
| IMS      | [11:10] | R/W | IIS master or slave mode select. (and select source of codec clock)<br>00 = Master mode<br>(PCLK is source clock for I2SSCLK, I2SLRCLK, I2SCDCLK)<br>01 = Master mode<br>(CLKAUDIO is source clock for I2SSCLK, I2SLRCLK.<br>CLKAUDIO-EPLL, EPLLRefCLK is source clock for I2SCDCLK)<br>10 = Slave mode (PCLK is source clock for I2SCDCLK)<br>11 = Slave mode<br>(CLKAUDIO-EPLL, EPLLRefCLK is source clock for I2SCDCLK)<br>(Refer to Figure 25-2) |
| TXR      | [9:8]   | R/W | Transmit or receive mode select.<br>00 = Transmit only mode<br>01 = Receive only mode<br>10 = Transmit and receive simultaneous mode<br>11 = Reserved  |
| LRP      | [7]     | R/W | Left/Right channel clock polarity select.<br>0 = Low for left channel and high for right channel<br>1 = High for left channel and low for right channel  |
| SDF      | [6:5]   | R/W | Serial data format.<br>00 = IIS format<br>01 = MSB-justified (left-justified) format<br>10 = LSB-justified (right-justified) format<br>11 = Reserved   |

| IISMOD | Bit   | R/W | Description  |
|--------|-------|-----|--|
| RFS    | [4:3] | R/W | IIS root clock (codec clock) frequency select.<br>00 = 256 fs, where fs is sampling frequency<br>01 = 512 fs<br>10 = 384 fs<br>11 = 768 fs<br>(Even in the slave mode, this bit should be set for correct) |
| BFS    | [2:1] | R/W | Bit clock frequency select.<br>00 = 32 fs, where fs is sampling frequency<br>01 = 48 fs<br>10 = 16 fs<br>11 = 24 fs<br>(Even in the slave mode, this bit should be set for correct)                        |
|        | [0]   | R/W | Reserved. Program to zero.   |

## 8.3 IIS FIFO CONTROL REGISTER (IISFIC)

| Register | Address    | Description                         | Reset Value |
|----------|------------|-------------------------------------|-------------|
| IISFIC   | 0x55000108 | IIS interface FIFO control register | 0x0000_0000 |

| IISFIC | Bit     | R/W | Description   |
|--------|---------|-----|---|
|        | [31:16] | R/W | Reserved. Program to zero.                          |
| TFLUSH | [15]    | R/W | TX FIFO flush command.<br>0 = No flush<br>1 = Flush |
|        | [14:13] | R/W | Reserved. Program to zero.                          |
| FTXCNT | [12:8]  | R   | TX FIFO data count. (0~16)                          |
| RFLUSH | [7]     | R/W | RX FIFO flush command.<br>0 = No flush<br>1 = Flush |
|        | [6:5]   | R/W | Reserved. Program to zero.                          |
| FRXCNT | [4:0]   | R   | RX FIFO data count. (0~16)                          |

**NOTE:** Tx FIFOs, Rx FIFO has 32-bit width and 16 depth structure, so FIFO data count value ranges from 0 to 16.

## 8.4 IIS PRESCALER CONTROL REGISTER (IISPSR)

| Register | Address    | Description                                  | Reset Value |
|----------|------------|--|-------------|
| IISPSR   | 0x5500010C | IIS interface clock divider control register | 0x0000_0000 |

| IISPSR | Bit     | R/W | Description  |
|--------|---------|-----|--|
|        | [31:16] | R/W | Reserved. Program to zero.   |
| PSRAEN | [15]    | R/W | Pre-scaler (Clock divider) active.<br>1 = Active (divide I2SAudioCLK with Pre-scaler division value)<br>0 = Inactive (bypass I2SAudioCLK) (Refer to Figure 25-2) |
|        | [14]    | R/W | Reserved. Program to zero.   |
| PSVALA | [13:8]  | R/W | Pre-scaler (Clock divider) division value.<br>N = Division factor is N+1 (1~1/64)  |
|        | [7:0]   | R/W | Reserved. Program to zero.   |

**8.5 IIS TRANSMIT REGISTER (IISTXD)**

| Register | Address    | Description                          | Reset Value |
|----------|------------|--------------------------------------|-------------|
| IISTXD   | 0x55000110 | IIS interface transmit data register | 0x0000_0000 |

| IISTXD | Bit    | R/W | Description   |
|--------|--------|-----|---|
| IISTXD | [31:0] | W   | TX FIFO write data. Note that the left/right channel data is allocated as the following bit fields.<br>R[23:0], L[23:0] when 24-bit BLC<br>R[31:16], L[15:0] when 16-bit BLC<br>R[23:16], L[7:0] when 8-bit BLC |

**8.6 IIS RECEIVE REGISTER (IISRXD)**

| Register | Address    | Description                         | Reset Value |
|----------|------------|-------------------------------------|-------------|
| IISRXD   | 0x55000114 | IIS interface receive data register | 0x0000_0000 |

| IISRXD | Bit    | R/W | Description  |
|--------|--------|-----|--|
| IISRXD | [31:0] | R   | RX FIFO read data. Note that the left/right channel data is allocated as the following bit fields.<br>R[23:0], L[23:0] when 24-bit BLC<br>R[31:16], L[15:0] when 16-bit BLC<br>R[23:16], L[7:0] when 8-bit BLC |

**NOTES**

# 26 IIS MULTI AUDIO INTERFACE

## 1 OVERVIEW

IIS (Inter-IC Sound) is one of the popular digital audio interface. The bus has only to handle audio data, while the other signals, such as sub-coding and control, are transferred separately. Surely, it is possible to transmit data between two IIS bus. To minimize the number of pins required and to keep wiring simple, basically, a 3-line serial bus is used consisting of a line for two time-multiplexed data channels, a word select line and a clock line.

IIS interface transmits or receives sound data from external stereo audio codec. For transmitting and receiving data, three 32x16 TXFIFOs(First-In-First-Out) and one 32x16 RXFIFO data structures are included and DMA transfer mode for transmitting or receiving samples can be supported. IIS-specific clock can be supplied from internal system clock controller through IIS clock divider or direct clock source.

## 2 FEATURE

- Up to 5.1ch IIS-bus for audio interface with DMA-based operation
- Serial, 8/16/24 bit per channel data transfers
- Supports IIS, MSB-justified and LSB-justified data format
- Three 32-bit width 16 depth Tx FIFOs, One 32-bit width 16 depth Rx FIFO

## 3 SIGNALS

| Name     | Direction    | Description                                       |
|----------|--------------|---|
| I2SLRCLK | Input/Output | IIS Multi Audio channel select(word select) clock |
| I2SSCLK  | Input/Output | IIS Multi Audio serial clock(bit clock)           |
| I2SCDCLK | Input/Output | IIS Multi Audio Codec clock                       |
| I2SSDI   | Input        | IIS Multi Audio serial data input                 |
| I2SSDO   | Output       | IIS Multi Audio serial data output 0              |
| I2SSDO_1 | Output       | IIS Multi Audio serial data output 1              |
| I2SSDO_2 | Output       | IIS Multi Audio serial data output 2              |

### 4 BLOCK DIAGRAM

Figure 26-1. IIS-Bus Block Diagram

### 5 FUNCTIONAL DESCRIPTIONS

IIS interface consists of register bank, FIFOs, shift registers, clock control, DMA finite state machine, and channel control block as shown in Figure 26-1. Note that each FIFO has 32-bit width and 16 depth structure, which contains left/right channel data. So, FIFO access and data transfer are handled with left/right pair unit. Figure 26-1 shows the internal functional block diagram of IIS interface, for actual GPIO pad name, please refer prior page's SIGNALS table. For more detail guide of GPIO setting, please refer the GPIO chapter.

## 5.1 MASTER/SLAVE MODE

Master or slave mode can be chosen by setting IMS bit of IISMOD register. In master mode, I2SSCLK and I2SLRCLK are generated internally and supplied to external device. Therefore a root clock is needed for generating I2SSCLK and I2SLRCLK by dividing. The IIS pre-scaler (clock divider) is employed for generating a root clock with divided frequency from internal system clock(PCLK, divided EPLL clock , EPLLrefCLK) and external I2S clock(from I2SCDCLK pad). The I2SSCLK and I2SLRCLK are supplied from the pin (GPIOs) in slave mode.

Master/Slave mode is different with TX/RX. Master/Slave mode presents the direction of I2SLRCLK and I2SSCLK. It doesn't matter the direction of I2SCDCLK (This is only auxiliary.) At slave mode, I2SCDCLK can be also going out for external IIS codec chip operation. If IIS bus interface transmits clock signals to IIS codec, IIS bus is master mode. But if IIS bus interface receives clock signal from IIS codec, IIS bus is slave mode. TX/RX mode indicates the direction of data flow. If IIS bus interface transmits data to IIS codec, this is TX mode. Conversely, IIS bus interface receives data from IIS codec that is RX mode. Let's distinguish Master/Slave mode from TX/RX mode.

Figure 26-2 shows the route of the root clock with internal master(PCLK, divided EPLL clock , EPLLrefClock) or external master(External I2S clock) mode setting in IIS clock control block and system controller. Note that RCLK indicates root clock and this clock can be supplied to external IIS codec chip at internal master mode and slave mode.(when CDCLKCON bit of IISMOD register is 1). At slave mode RCLK doesn't affect to I2SSCLK and I2SLRCLK, but for correct I2S functioning setting RFS, BFS are needed.

Figure 26-2. IIS Clock Control Block Diagram

## 5.2 DMA TRANSFER

In the DMA transfer mode, the transmitter or receiver FIFO are accessible by DMA controller. DMA service request is activated internally by the transmitter or receiver FIFO state. The FTXEMPT, FRXEMPT, FTXFULL, and FRXFULL bits of I2SCON register represent the transmitter or receiver FIFO data state. Especially, FTXEMPT and FRXFULL bit are the ready flag for DMA service request; the transmit DMA service request is activated when TXFIFO is not empty and the receiver DMA service request is activated when RXFIFO is not full.

The DMA transfer uses only handshaking method for single data. Note that during DMA acknowledge activation, the data read or write operation should be performed.

\* DMA request point

- TX mode : ( FIFO is not full ) & ( TXDMACTIVE is active )
- RX mode : ( FIFO is not empty ) & ( RXDMACTIVE is active )

### NOTE

It only supports single transfer in DMA mode.

## 6 AUDIO SERIAL DATA FORMAT

### 6.1 IIS-BUS FORMAT

The IIS bus has four lines including serial data input I2SSDI, serial data output I2SSDO, left/right channel select clock I2SLRCLK, and serial bit clock I2SSCLK; the device generating I2SLRCLK and I2SSCLK is the master.

Serial data is transmitted in 2's complement with the MSB first with a fixed position, whereas the position of the LSB depends on the word length. The transmitter sends the MSB of the next word at one clock period after the I2SLRCLK is changed. Serial data sent by the transmitter may be synchronized with either the trailing or the leading edge of the clock signal. However, the serial data must be latched into the receiver on the leading edge of the serial clock signal, and so there are some restrictions when transmitting data that is synchronized with the leading edge.

The LR channel select line indicates the channel being transmitted. I2SLRCLK may be changed either on a trailing or leading edge of the serial clock, but it does not need to be symmetrical. In the slave, this signal is latched on the leading edge of the clock signal. The I2SLRCLK line changes one clock period before the MSB is transmitted. This allows the slave transmitter to derive synchronous timing of the serial data that will be set up for transmission. Furthermore, it enables the receiver to store the previous word and clear the input for the next word.

### 6.2 MSB (LEFT) JUSTIFIED

MSB-Justified (Left-Justified) format is similar to IIS bus format, except that in MSB-justified format, the transmitter always sends the MSB of the next word at the same time whenever the I2SLRCLK is changed.

### 6.3 LSB (RIGHT) JUSTIFIED

LSB-Justified (Right-Justified) format is opposite to the MSB-justified format. In other word, the transferring serial data is aligned with ending point of I2SLRCLK transition.

Figure 26-3 shows the audio serial format of IIS, MSB-justified, and LSB-justified. Note that in this figure, the word length is 16 bit and I2SLRCLK makes transition every 24 cycle of I2SSCLK (BFS is 48 fs, where fs is sampling frequency; I2SLRCLK frequency).

Figure 26-3. IIS Audio Serial Data Formats

## 6.4 SAMPLING FREQUENCY AND MASTER CLOCK

Master clock frequency (RCLK) can be selected by sampling frequency as shown in Table 26-1. Because RCLK is made by IIS pre-scaler, the pre-scaler value and RCLK type (256fs or 384fs or 512fs or 768fs) should be determined properly.

**Table 26-1. CODEC clock (CODECLK = 256fs, 384fs, 512fs, 768fs)**

| IISLRCK (fs)  | 8.000 kHz | 11.025 kHz | 16.000 kHz | 22.050 kHz | 32.000 kHz | 44.100 kHz | 48.000 kHz | 64.000 kHz | 88.200 kHz | 96.000 kHz |
|---------------|-----------|------------|------------|------------|------------|------------|------------|------------|------------|------------|
| CODECLK (MHz) | 256fs     |            |            |            |            |            |            |            |            |            |
|               | 2.0480    | 2.8224     | 4.0960     | 5.6448     | 8.1920     | 11.2896    | 12.2880    | 16.3840    | 22.5792    | 24.5760    |
|               | 384fs     |            |            |            |            |            |            |            |            |            |
|               | 3.0720    | 4.2336     | 6.1440     | 8.4672     | 12.2880    | 16.9344    | 18.4320    | 24.5760    | 33.8688    | 36.8640    |
|               | 512fs     |            |            |            |            |            |            |            |            |            |
|               | 4.0960    | 5.6448     | 8.1920     | 11.2900    | 16.3840    | 22.5790    | 24.5760    | 32.7680    | 45.1580    | 49.1520    |
|               | 768fs     |            |            |            |            |            |            |            |            |            |
| 6.1440        | 8.4672    | 12.2880    | 16.9340    | 24.5760    | 33.8690    | 36.8640    | 49.1520    | -          | -          |            |

**NOTE:** fs represents sampling frequency.

CODECLK Frequency = fs \* (256 or 384 or 512 or 768)

## 6.5 IIS CLOCK MAPPING TABLE

On selecting BFS, RFS, and BLC bits of I2SMOD register, user should refer to the following table. Table 26-2 shows the allowable clock frequency mapping relations.

**Table 26-2. IIS Clock Mapping Table**

| Clock Frequency |             | RFS   |              |              |              |
|-----------------|-------------|---|--------------|--------------|--------------|
|                 |             | 256 fs (00B)  | 512 fs (01B) | 384 fs (10B) | 768 fs (11B) |
| BFS             | 16 fs (10B) | (a)   | (a)          | (a)          | (a)          |
|                 | 24 fs (11B) | -   | -            | (a)          | (a)          |
|                 | 32 fs (00B) | (a) (b)   | (a) (b)      | (a) (b)      | (a) (b)      |
|                 | 48 fs (01B) | -   | -            | (a) (b) (c)  | (a) (b) (c)  |
| Descriptions    |             | (a) Allowed when BLC is 8-bit (01B)<br>(b) Allowed when BLC is 16-bit (00B)<br>(c) Allowed when BLC is 24-bit (10B) |              |              |              |

**NOTE:** Bit Clock Frequency  $\geq$  fs \* (bit length \* 2). Under this condition Bit Clock Frequency can be one of among fs \* (16 or 24 or 32 or 48). The codec clock is a multiple of the bit clock among fs \* (256 or 384 or 512 or 768)

**Example:** If bit length is 16 bit, Bit Clock Frequency  $\geq$  fs \* 32. So it can be one of fs \* (32 or 48).  
If Bit Clock Frequency is 48 fs, then 384fs(48 fs\* 8) and 768fs(48 fs \* 16) are the clock which is a multiple of the Bit Clock Frequency.

## 7 PROGRAMMING GUIDE

The IIS bus interface can be accessed either by the processor using programmed I/O instructions or by the DMA controller.

### 7.1 INITIALIZATION

1. Before you use IIS bus interface, you have to configure GPIOs to IIS mode. And check signal's direction. I2SLRCLK, I2SSCLK and I2SCDCLK is inout-type. The each of I2SSDI and I2SSDO is input and output.
2. Now then, you choose clock source. S3C2451 has four clock sources. Those are PCLK, divided EPLL clock EPLLRefCLK and external codec. If you want to know more detail, refer Figure 26-2.

### 7.2 PLAY MODE (TX MODE) WITH DMA

1. TXFIFO is flushed before operation. If you don't distinguish Master/Slave mode from TX/RX mode, you must study Master/Slave mode and TX/RX mode. Refer Master/Slave chapter.
2. To configure I2SMOD register and I2SPSR (IIS pre-scaler register) properly.
3. To operate system in stability, the internal TXFIFO should be almost full before transmission. First of all, DMA starts because of that reason.
4. Basically, IIS bus doesn't support the interrupt. So, you can only check state by polling through accessing SFR.
5. If TXFIFO is full, now then you make I2SACTIVE be asserted.

### 7.3 RECORDING MODE (RX MODE) WITH DMA

1. RXFIFO is flushed before operation. Also, if you don't distinguish between Master/Slave mode and TX/RX mode, you must study Master/Slave mode and TX/RX mode. Refer Master/Slave chapter.
2. To configure I2SMOD register and I2SPSR (IIS pre-scaler register) properly.
3. To operate system in stability, the internal RXFIFO should have at least one data before DMA operation. Because of that reason, you make I2SACTIVE be asserted.
4. Now then you check RXFIFO state by polling through accessing SFR.
5. If RXFIFO is not empty, let's start RXDMACTIVE.

## 7.4 EXAMPLE CODE

### TX CHANNEL

The I2S TX channel provides single/double/tripple stereo compliant outputs. The transmit channel can operate in master or Slave mode. Data is transferred between the processor and the I2S controller via an APB access or a DMA access.

The processor must write words in multiples of two (i.e. for left and right audio sample).The words are serially shifted out timed with respect to the audio serial BITCLK, SCLK and word select clock, LRCLK.

TX Channel has 16X32 bit wide FIFO where the processor or DMA can write UPTO 16 left/right data samples after enabling the channel for transmission.

An Example sequence is as the following.

Ensure the PCLK and CLKAUDIO are coming correctly to the I2S controller and FLUSH the TX FIFO using the TFLUSH bit in the I2SFIC Register (I2S FIFO Control Register).

Please ensure that I2S Controller is configured in one of the following modes.

- TX only mode
- TX/RX simultaneous mode

This can be done by programming the TXR bit in the I2SMOD Register (I2S Mode Register).

1. Then Program the following parameters according to the need

- IMS
- SDF
- BFS
- BLC
- LRP

For Programming, the above-mentioned fields please refer I2SMOD Register (I2S Mode Register).

2. Once ensured that the input clocks for I2S controller are up and running and step 1 and 2 have been completed we can write to TX FIFO.

The write to the TX FIFO has to be carried out thorough the I2STXD Register (I2S TX FIFO Register)

This 32 bit data will occupy position 0 of the FIFO and any further data will be written to position 2, 3 and so on.

The Data is aligned in the TX FIFO for 8-bits/channel or 16-bits/channel BLC as shown

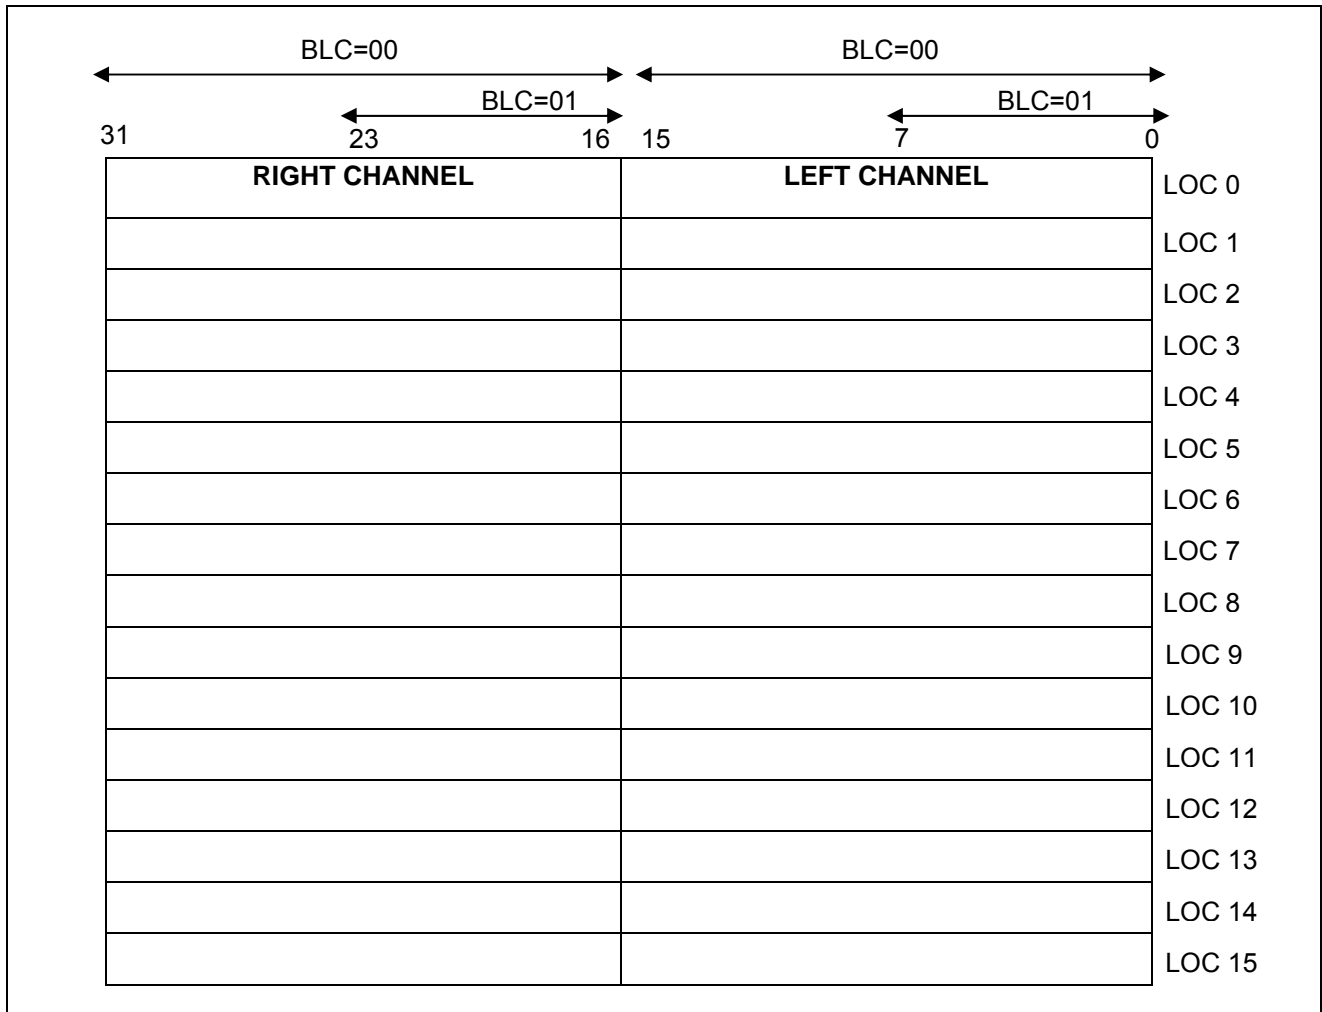

Figure 26-4. TX FIFO Structure for BLC = 00 or BLC = 01

The Data is aligned in the TX FIFO for 24-bits/channel BLC as shown

**Figure 26-5. TX FIFO Structure for BLC = 10 (24-bits/channel)**

Once the data is written to the TX FIFO the TX channel can be made active by enabling the I2SACTIVE bit in the I2SCON Register (I2S Control Register).

The data is then serially shifted out with respect to the serial bit clock SCLK and word select clock LRCLK.

The TXCHPAUSE in the I2SCON Register (I2S Control Register) can stop the serial data transmission on the I2SSDO. The transmission is stopped once the current Left/Right channel is transmitted.

If the control registers in the I2SCON Register (I2S Control Register) and I2SMOD Register (I2S Mode Register) are to be reprogrammed then it is advisable to disable the TX channel.

If the TX channel is enabled while the FIFO is empty, no samples are read from the FIFO.

The Status of TX FIFO can be checked by checking the bits in the I2SFIC Register (I2S FIFO Control Register).

## RX CHANNEL

The I2S RX channel provides a single stereo compliant output. The receive channel can operate in master or slave mode. Data is received from the input line and transferred into the RX FIFO. The processor can then read this data via an APB read or a DMA access can access this data.

RX Channel has a 16X32 bit wide RX FIFO where the processor or DMA can read UPTO 16 left/right data samples after enabling the channel for reception.

An Example sequence is as following.

Ensure the PCLK and CLKAUDIO are coming correctly to the I2S controller and FLUSH the RX FIFO using the RFLUSH bit in the I2SFIC Register (I2S FIFO Control Register) and the I2S controller is configured in any of the modes

- Receive only.
- Receive/Transmit simultaneous mode

This can be done by Programming the TXR bit in the I2SMOD Register (I2S Mode Register)

1. Then Program the following parameters according to the need
  - IMS
  - SDF
  - BFS
  - BLC
  - LRP

For Programming, the above mentioned fields please refer I2SMOD Register (I2S Mode Register)

2. Once ensured that the input clocks for I2S controller are up and running and step 1 and 2 have been completed user must put the I2SACTIVE high to enable any reception of data, the I2S Controller receives data on the LRCLK change.

The Data must be read from the RX FIFO using the I2SRXD Register (I2S RX FIFO Register) only after looking at the RX FIFO count in the I2SFIC Register (I2S FIFO Control Register). The count would only increment once the complete left channel and right have been received.

The Data is aligned in the RX FIFO for 8-bits/channel or 16-bits/channel BLC as shown

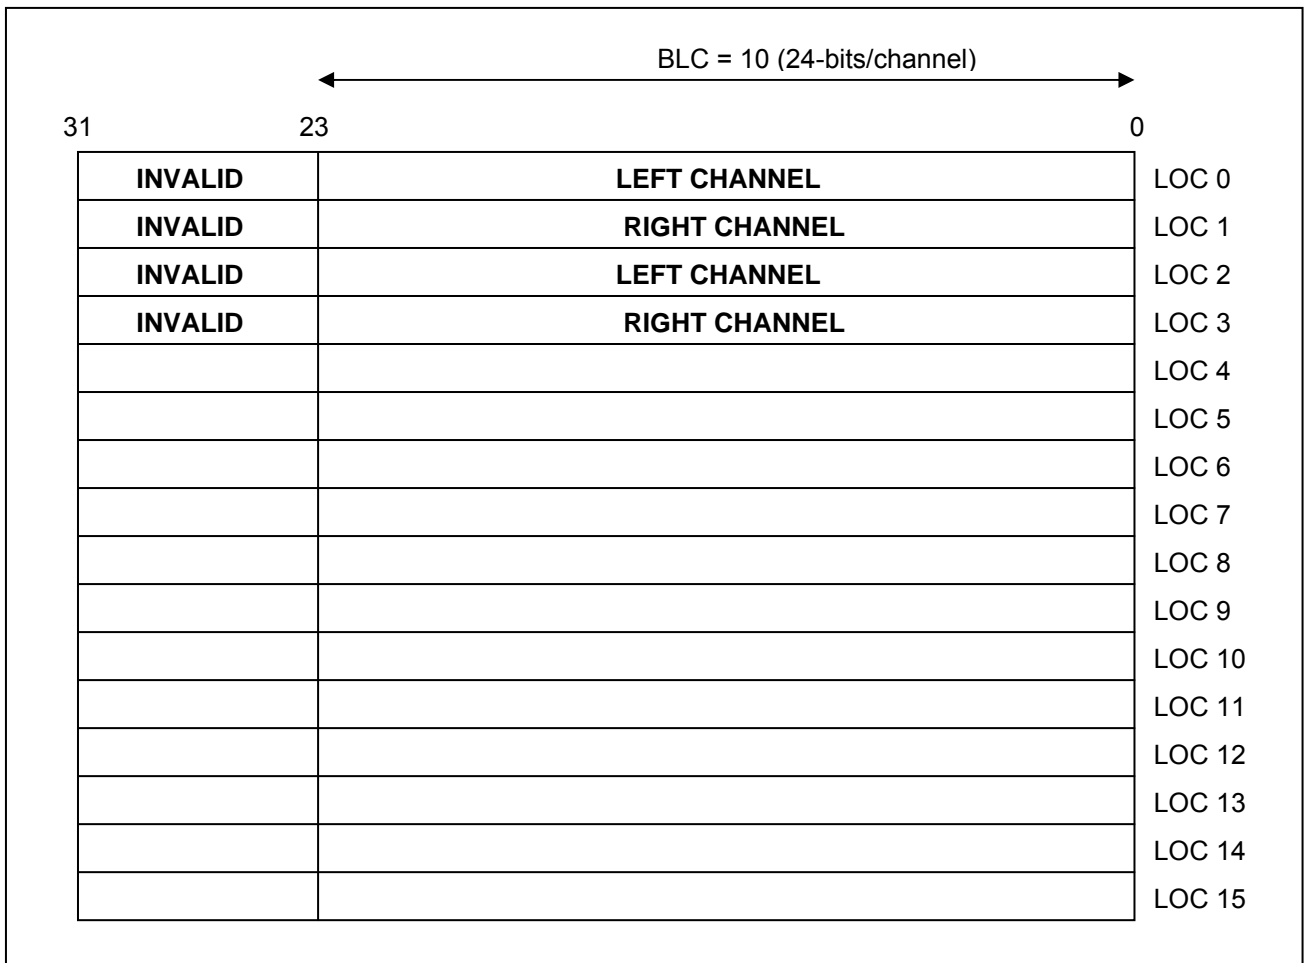

Figure 26-6. RX FIFO Structure for BLC = 00 or BLC = 01

The Data is aligned in the RX FIFO for 24-bits/channel BLC as shown

**Figure 26-7. RX FIFO Structure for BLC = 10 (24-bits/channel)**

The RXCHPAUSE in the I2SCON register can stop the serial data reception on the I2SSDI. The reception is stopped once the current Left/Right channel is received. If the control registers in the I2SCON Register (I2S Control Register) and I2SMOD Register (I2S Mode Register) are to be reprogrammed then it is advisable to disable the RX channel.

The Status of RX FIFO can be checked by checking the bits in the I2SFIC Register (I2S FIFO Control Register).

## 8 IIS-BUS INTERFACE SPECIAL REGISTERS

Table 26-3. Register Summary of IIS Interface

| Register | Address    | R/W | Description                                  | Reset Value |
|----------|------------|-----|--|-------------|
| IISCON   | 0x55000000 | R/W | IIS interface control register               | 0xC600      |
| IISMOD   | 0x55000004 | R/W | IIS interface mode register                  | 0x0         |
| IISFIC   | 0x55000008 | R/W | IIS interface FIFO control register          | 0x0         |
| IISPSR   | 0x5500000C | R/W | IIS interface clock divider control register | 0x0         |
| IISTXD   | 0x55000010 | W   | IIS interface transmit data register         | 0x0         |
| IISRXD   | 0x55000014 | R   | IIS interface receive data register          | 0x0         |

**NOTE:** All registers of IIS interface are accessible by word unit with STR/LDR instructions.

## 8.1 IIS CONTROL REGISTER (IISCON)

| Register | Address    | Description                    | Reset Value |
|----------|------------|--------------------------------|-------------|
| IISCON   | 0x55000000 | IIS interface control register | 0x0000_C600 |

| IISCON      | Bit     | R/W | Description   |
|-------------|---------|-----|---|
| Reserved    | [31:18] | R/W | Reserved. Program to zero.  |
| FTXURSTATUS | [17]    | R/W | TX FIFO under-run interrupt status. And this is used by interrupt clear bit. When this is high, you can do interrupt clear by writing '1'.<br>0 = Interrupt didn't be occurred.<br>1 = Interrupt was occurred.  |
| FTXURINTEN  | [16]    | R/W | TX FIFO Under-run Interrupt Enable<br>0 = TXFIFO Under-run INT disable<br>1 = TXFIFO Under-run INT enable 1)  |
| FTX2EMPT    | [15]    | R   | TX FIFO2 empty Status Indication<br>0 = TX FIFO2 is not empty(Ready to transmit Data)<br>1 = TX FIFO2 is empty (Not Ready to transmit Data)   |
| FTX1EMPT    | [14]    | R   | TX FIFO1 empty Status Indication<br>0 = TX FIFO1 is not empty(Ready to transmit Data)<br>1 = TX FIFO1 is empty (Not Ready to transmit Data)   |
| FTX2FULL    | [13]    | R   | TX FIFO2 full Status Indication<br>0 = TX FIFO2 is not full<br>1 = TX FIFO2 is full   |
| FTX1FULL    | [12]    | R   | TX FIFO1 full Status Indication<br>0 = TX FIFO1 is not full<br>1 = TX FIFO1 is full   |
| LRI         | [11]    | R   | Left/Right channel clock indication. Note that LRI meaning is dependent on the value of LRP bit of I2SMOD register.<br>0 = Left (when LRP bit is low) or right (when LRP bit is high)<br>1 = Right (when LRP bit is low) or left (when LRP bit is high) |
| FTX0EMPT    | [10]    | R   | Tx FIFO0 empty status indication.<br>0 = FIFO is not empty (ready for transmit data to channel)<br>1 = FIFO is empty (not ready for transmit data to channel)   |
| FRXEMPT     | [9]     | R   | Rx FIFO empty status indication.<br>0 = FIFO is not empty<br>1 = FIFO is empty  |
| FTX0FULL    | [8]     | R   | Tx FIFO0 full status indication.<br>0 = FIFO is not full<br>1 = FIFO is full  |

| IISCON     | Bit | R/W | Description  |
|------------|-----|-----|--|
| FRXFULL    | [7] | R   | Rx FIFO full status indication.<br>0 = FIFO is not full (ready for receive data from channel)<br>1 = FIFO is full (not ready for receive data from channel)  |
| TXDMAPAUSE | [6] | R/W | Tx DMA operation pause command. Note that when this bit is activated at any time, the DMA request will be halted after current on-going DMA transfer is completed.<br>0 = No pause DMA operation<br>1 = Pause DMA operation      |
| RXDMAPAUSE | [5] | R/W | Rx DMA operation pause command. Note that when this bit is activated at any time, the DMA request will be halted after current on-going DMA transfer is completed.<br>0 = No pause DMA operation<br>1 = Pause DMA operation      |
| TXCHPAUSE  | [4] | R/W | Tx channel operation pause command. Note that when this bit is activated at any time, the channel operation will be halted after left-right channel data transfer is completed.<br>0 = No pause operation<br>1 = Pause operation |
| RXCHPAUSE  | [3] | R/W | Rx channel operation pause command. Note that when this bit is activated at any time, the channel operation will be halted after left-right channel data transfer is completed.<br>0 = No pause operation<br>1 = Pause operation |
| TXDMACTIVE | [2] | R/W | Tx DMA active (start DMA request). Note that when this bit is set from high to low, the DMA operation will be forced to stop immediately.<br>0 = Inactive<br>1 = Active  |
| RXDMACTIVE | [1] | R/W | Rx DMA active (start DMA request). Note that when this bit is set from high to low, the DMA operation will be forced to stop immediately.<br>0 = Inactive<br>1 = Active  |
| I2SACTIVE  | [0] | R/W | IIS interface active (start operation).<br>0 = Inactive<br>1 = Active  |

**NOTE:** When playing is finished, overrun interrupt will be occur. (Since no more data are written into TXFIFO at the end of playing.) User can stop transmission at this overrun interrupt.

## 8.2 IIS MODE REGISTER (IISMOD)

| Register | Address    | Description                 | Reset Value |
|----------|------------|-----------------------------|-------------|
| IISMOD   | 0x55000004 | IIS interface mode register | 0x0000_0000 |

| IISMOD   | Bit     | R/W | Description  |
|----------|---------|-----|--|
| Reserved | [31:15] | R/W | Reserved. Program to zero.   |
| CDD2     | [21:20] | R/W | Channel-2 Data Discard. Discard means zero padding. It only supports 8/16 bit mode.<br>00 = No Discard<br>01 = I2STXD[15:0] Discard<br>10 = I2STXD[31:16] Discard<br>11 = Reserved   |
| CDD1     | [19:18] | R/W | Channel-1 Data Discard. Discard means zero padding. It only supports 8/16 bit mode.<br>00 = No Discard<br>01 = I2STXD[15:0] Discard<br>10 = I2STXD[31:16] Discard<br>11 = Reserved   |
| DCE      | [17:16] | R/W | Data Channel Enable.<br>[17] = SD2 channel enable<br>[16] = SD1 channel enable   |
|          | [15]    | R/W | Reserved, Program to Zero  |
| BLC      | [14:13] | R/W | Bit Length Control Bit Which decides transmission of 8/16 bits per audio channel<br>00 = 16 Bits per channel<br>01 = 8 Bits Per Channel<br>10 = 24 Bits Per Channel<br>11 = Reserved   |
| CDCLKCON | [12]    | R/W | Determine direction of codec clock(I2SCDCLK)<br>0 = Supply codec clock to external codec chip.<br>(from PCLK, EPLL, EPLLRefCLK)<br>1 = Get codec clock from external codec chip. (to CLKAUDIO)<br>(Refer to Figure 26-2)   |
| IMS      | [11:10] | R/W | IIS master or slave mode select. (and select source of codec clock)<br>00 = Master mode<br>(PCLK is source clock for I2SSCLK, I2SLRCLK, I2SCDCLK)<br>01 = Master mode<br>(CLKAUDIO is source clock for I2SSCLK, I2SLRCLK.<br>CLKAUDIO-EPLL, EPLLRefCLK is source clock for I2SCDCLK)<br>10 = Slave mode (PCLK is source clock for I2SCDCLK)<br>11 = Slave mode<br>(CLKAUDIO-EPLL, EPLLRefCLK is source clock for I2SCDCLK)<br>(Refer to Figure 26-2) |

| IISMOD | Bit   | R/W | Description  |
|--------|-------|-----|--|
| TXR    | [9:8] | R/W | Transmit or receive mode select.<br>00 = Transmit only mode<br>01 = Receive only mode<br>10 = Transmit and receive simultaneous mode<br>11 = Reserved  |
| LRP    | [7]   | R/W | Left/Right channel clock polarity select.<br>0 = Low for left channel and high for right channel<br>1 = High for left channel and low for right channel  |
| SDF    | [6:5] | R/W | Serial data format.<br>00 = IIS format<br>01 = MSB-justified (left-justified) format<br>10 = LSB-justified (right-justified) format<br>11 = Reserved   |
| RFS    | [4:3] | R/W | IIS root clock (codec clock) frequency select.<br>00 = 256 fs, where fs is sampling frequency<br>01 = 512 fs<br>10 = 384 fs<br>11 = 768 fs<br>(Even in the slave mode, this bit should be set for correct) |
| BFS    | [2:1] | R/W | Bit clock frequency select.<br>00 = 32 fs, where fs is sampling frequency<br>01 = 48 fs<br>10 = 16 fs<br>11 = 24 fs<br>(Even in the slave mode, this bit should be set for correct)                        |
|        | [0]   | R/W | Reserved. Program to zero.   |

## 8.3 IIS FIFO CONTROL REGISTER (IISFIC)

| Register | Address    | Description                         | Reset Value |
|----------|------------|-------------------------------------|-------------|
| IISFIC   | 0x55000008 | IIS interface FIFO control register | 0x0000_0000 |

| IISFIC  | Bit     | R/W | Description   |
|---------|---------|-----|---|
|         | [31:29] | R/W | Reserved. Program to zero.                          |
| FTX2CNT | [28:24] | R   | TX FIFO2 data count. (0 ~ 16)                       |
|         | [23:21] | R/W | Reserved. Program to zero.                          |
| FTX1CNT | [20:16] | R   | TX FIFO1 data count. (0~16)                         |
| TFLUSH  | [15]    | R/W | TX FIFO flush command.<br>0 = No flush<br>1 = Flush |
|         | [14:13] | R/W | Reserved. Program to zero.                          |
| FTX0CNT | [12:8]  | R   | TX FIFO0 data count. (0~16)                         |
| RFLUSH  | [7]     | R/W | RX FIFO flush command.<br>0 = No flush<br>1 = Flush |
|         | [6:5]   | R/W | Reserved. Program to zero.                          |
| FRXCNT  | [4:0]   | R   | RX FIFO data count. (0~16)                          |

**NOTE:** Tx FIFOs, Rx FIFO has 32-bit width and 16 depth structure, so FIFO data count value ranges from 0 to 16.

## 8.4 IIS PRESCALER CONTROL REGISTER (IISPSR)

| Register | Address    | Description                                  | Reset Value |
|----------|------------|--|-------------|
| IISPSR   | 0x5500000C | IIS interface clock divider control register | 0x0000_0000 |

| IISPSR | Bit     | R/W | Description  |
|--------|---------|-----|--|
|        | [31:16] | R/W | Reserved. Program to zero.   |
| PSRAEN | [15]    | R/W | Pre-scaler (Clock divider) active.<br>1 = Active (divide I2SAudioCLK with Pre-scaler division value)<br>0 = Inactive (bypass I2SAudioCLK) (Refer to Figure 26-2) |
|        | [14]    | R/W | Reserved. Program to zero.   |
| PSVALA | [13:8]  | R/W | Pre-scaler (Clock divider) division value.<br>N: Division factor is N+1 (1~1/64)   |
|        | [7:0]   | R/W | Reserved. Program to zero.   |

**8.5 IIS TRANSMIT REGISTER (IISTXD)**

| Register | Address    | Description                          | Reset Value |
|----------|------------|--------------------------------------|-------------|
| IISTXD   | 0x55000010 | IIS interface transmit data register | 0x0000_0000 |

| IISTXD | Bit    | R/W | Description   |
|--------|--------|-----|---|
| IISTXD | [31:0] | W   | TX FIFO write data. Note that the left/right channel data is allocated as the following bit fields.<br>R[23:0], L[23:0] when 24-bit BLC<br>R[31:16], L[15:0] when 16-bit BLC<br>R[23:16], L[7:0] when 8-bit BLC |

**8.6 IIS RECEIVE REGISTER (IISRXD)**

| Register | Address    | Description                         | Reset Value |
|----------|------------|-------------------------------------|-------------|
| IISRXD   | 0x55000014 | IIS interface receive data register | 0x0000_0000 |

| IISRXD | Bit    | R/W | Description  |
|--------|--------|-----|--|
| IISRXD | [31:0] | R   | RX FIFO read data. Note that the left/right channel data is allocated as the following bit fields.<br>R[23:0], L[23:0] when 24-bit BLC<br>R[31:16], L[15:0] when 16-bit BLC<br>R[23:16], L[7:0] when 8-bit BLC |

## NOTES

# 27 AC97 CONTROLLER

## 1 OVERVIEW

The AC97 Controller Unit of the S3C2451 supports the AC97 revision 2.0 features. AC97 Controller communicates with AC97 Codec using audio controller link (AC-link). Controller sends the stereo PCM data to Codec. The external digital-to-analog converter (DAC) in the Codec then converts the audio sample to an analog audio waveform. Also, Controller receives the stereo PCM data and the mono Mic data from Codec then store in memories. This chapter describes the programming model for the AC97 Controller Unit. The information in this chapter requires an understanding of the AC97 revision 2.0 specifications.

### 1.1 FEATURE

- Independent channels for stereo PCM In(Slot3, Slot4), mono MIC In(Slot 6), stereo PCM Out(Slot3, Slot4).
- DMA-based operation and interrupt based operation.
- All of the channels support only 16-bit samples.
- Variable sampling rate AC97 Codec interface (48kHz and below)
- 16-bit, 16 entry FIFOs per channel
- Only primary Codec support

### 1.2 SIGNALS

| Name       | Direction | Description                             |
|------------|-----------|---|
| AC_nRESET  | Output    | Active-low CODEC reset.                 |
| AC_BIT_CLK | Input     | 12.288MHz bit-rate clock                |
| AC_SYNC    | Output    | 48 kHz frame indicator and synchronizer |
| AC_SDO     | Output    | Serial audio output data.               |
| AC_SDI     | Input     | Serial audio input data.                |

## 2 AC97 CONTROLLER OPERATION

This section explains the AC97 controller operation. Also it says to program guide. You must study AC-Link, Power-down sequence and Wake-up sequence.

### 2.1 BLOCK DIAGRAM

Figure 27-1 shows the functional block diagram of S3C2451 AC97 Controller. The AC97 signals form the AC-link, which is a point-to-point synchronous serial inter-connecting that supports full-duplex data transfers. All digital audio streams and command/status information are communicated over the AC-link.

Figure 27-1. AC97 Block Diagram

2.2 INTERNAL DATA PATH

Figure 27-2 shows the internal data path of S3C2451 AC97 Controller. It has stereo Pulse Code Modulated (PCM) In, Stereo PCM Out and mono Mic-in buffers, which consist of 16-bit, 16 entries buffer. It also has 20-bit I/O shift register via AC-link.

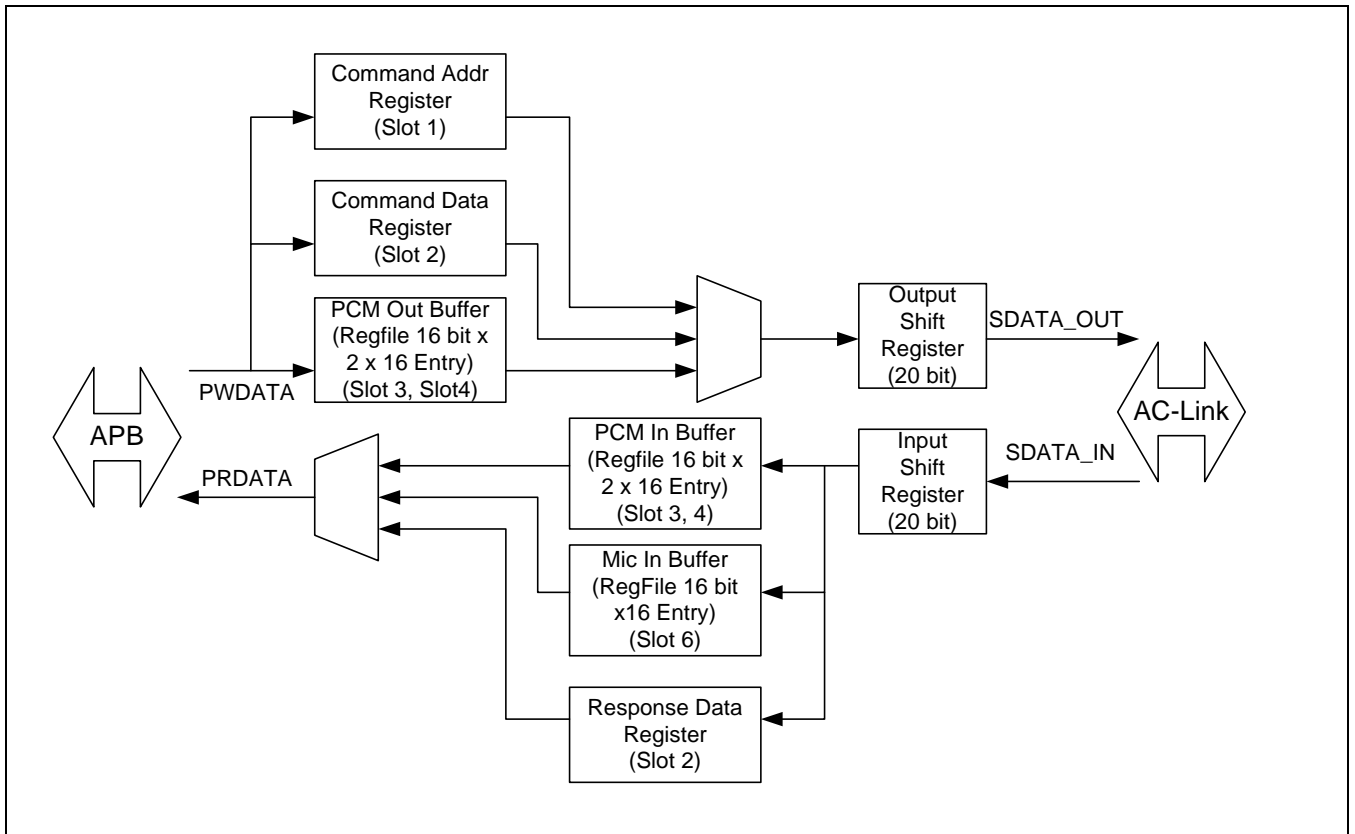

Figure 27-2. Internal Data Path

### 3 OPERATION FLOW CHART

When you initialize the AC97 controller, you must assert system reset or cold reset. Because we don't know the previous state of the external the AC97 audio-codec. This assumes that GPIO is already ready. Then you make codec ready interrupt enable. You can check codec ready interrupt by polling or interrupt. When interrupt is occurred, you must de-assert codec ready interrupt. Now then you can transmit data from memory to register, or from register to memory by using DMA or PIO(directly to write data to register). If internal FIFOs (TX FIFO or RX FIFO) is not empty, then let data be transmitted. In addition, you can previously turn on AC-Link.

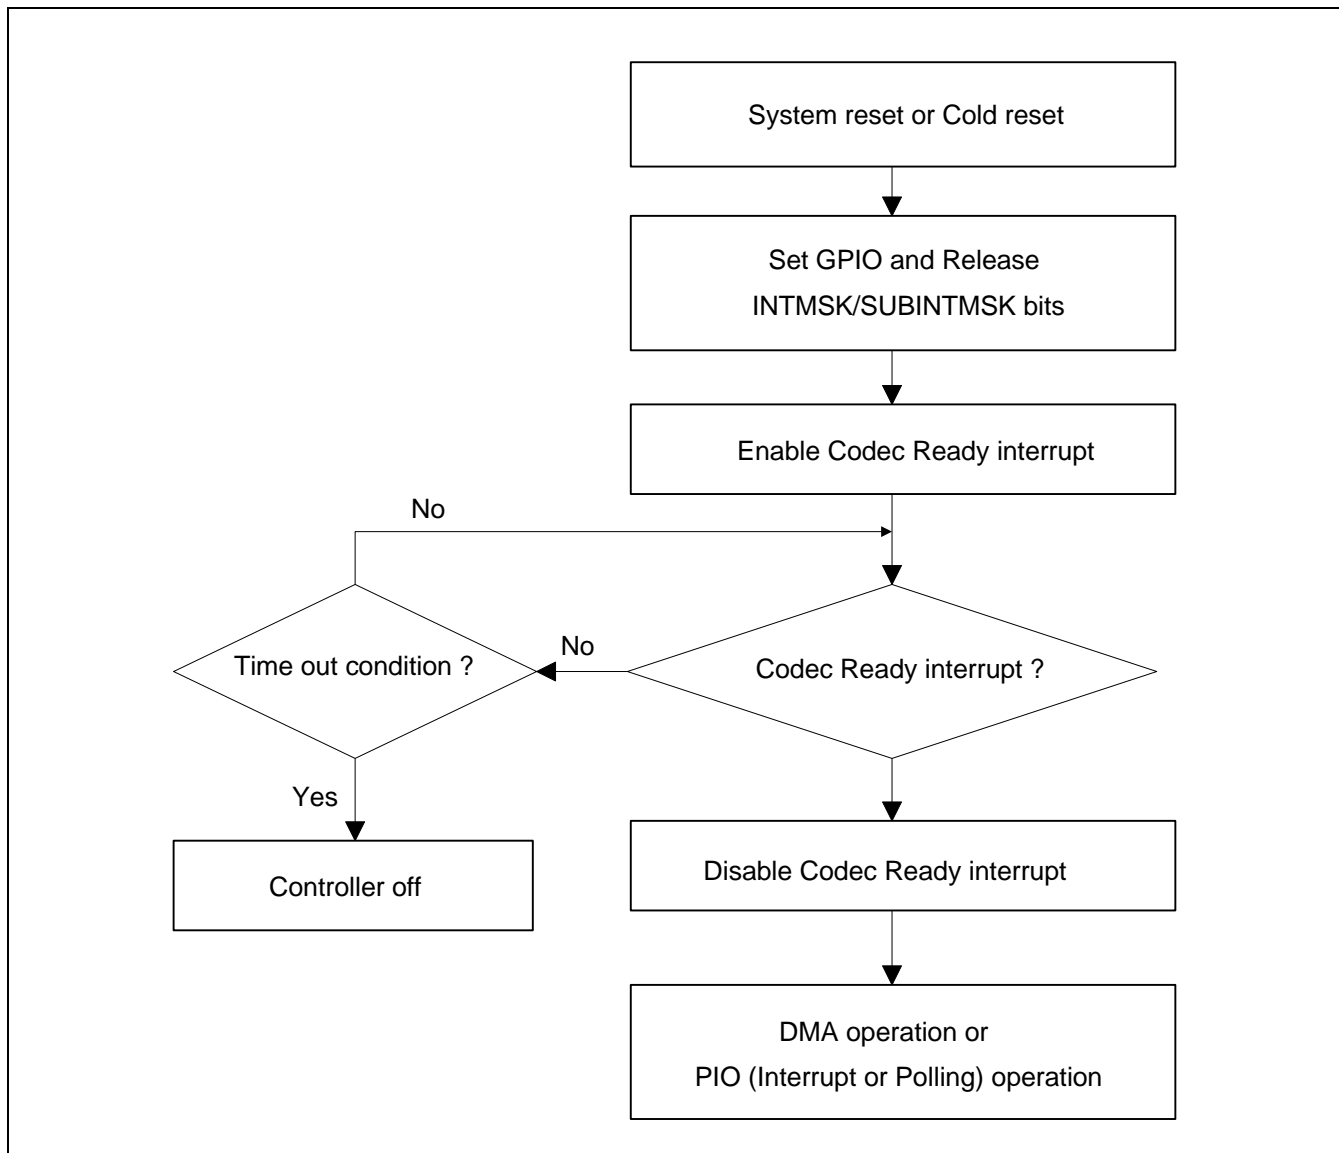

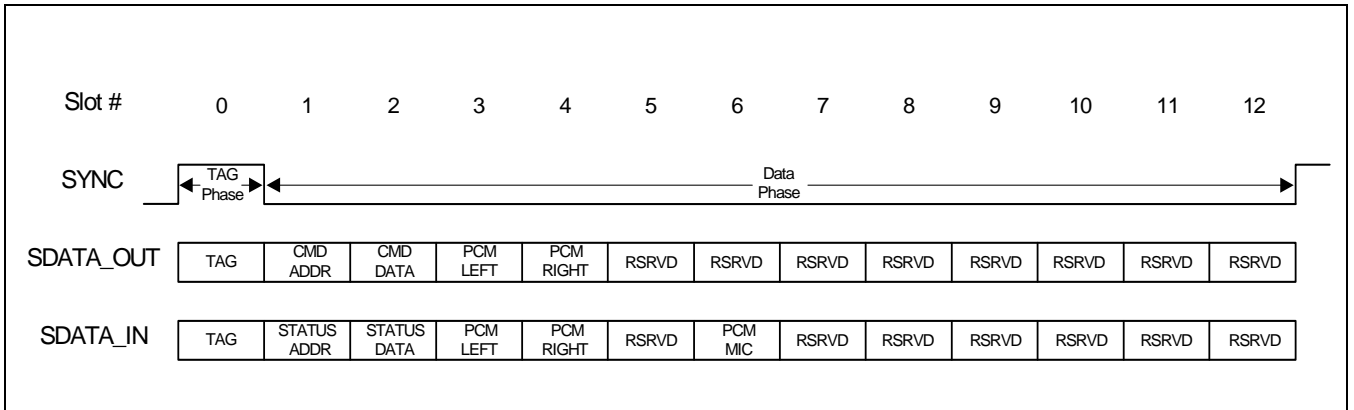

Figure 27-3. AC97 Operation Flow Chart

### 4 AC-LINK DIGITAL INTERFACE PROTOCOL

Each AC97 Codec incorporates a five-pin digital serial interface that links it to the S3C2451 AC97 Controller. AC-link is a full-duplex, fixed-clock, PCM digital stream. It employs a time division multiplexed (TDM) scheme to handle control register accesses and multiple input and output audio streams. The AC-link architecture divides each audio frame into 12 outgoing and 12 incoming data streams. Each stream has 20-bit sample resolution and requires a DAC and an analog-to-digital converter (ADC) with a minimum 16-bit resolution.

**Figure 27-4. Bi-directional AC-link Frame with Slot Assignments**

Figure 27-4 shows the slot definitions that the S3C2451 AC97 Controller supports. The S3C2451 AC97 Controller provides synchronization for all data transaction on the AC-link.

A data transaction is made up of 256 bits of information broken up into groups of 13 time slots and is called a frame. Time slot 0 is called the Tag Phase and is 16 bits long. The other 12 time slots are called the Data Phase. The Tag Phase contains one bit that identifies a valid frame and 12 bits that identify the time slots in the Data Phase that contain valid data. Each time slot in the Data Phase is 20 bits long. A frame begins when SYNC goes high. The amount of time that SYNC is high corresponds to the Tag Phase. AC97 frames occur at fixed 48 kHz intervals and are synchronous to the 12.288 MHz bit rate clock, BITCLK. The controller and the Codec use the SYNC and BITCLK to determine when to send transmit data and when to sample received data. A transmitter transitions the serial data stream on each rising edge of BITCLK and a receiver samples the serial data stream on falling edges of BITCLK. The transmitter must tag the valid slots in its serial data stream. The valid slots are tagged in slot 0. Serial data on the AC-link is ordered most significant bit (MSB) to least significant bit (LSB). The Tag Phase's first bit is bit 15 and the first bit of each slot in Data Phase is bit 19. The last bit in any slot is bit 0.

## 4.1 AC-LINK OUTPUT FRAME (SDATA\_OUT)

### Slot 0: Tag Phase

In slot 0, the first bit is a bit (SDATA\_OUT, bit 15) which represents the validity of the entire frame. If bit 15 is a 1, the current frame contains at least a valid time slot. The next 12 bit positions correspond each 12 time slot contains valid data. Bits 0 and 1 of slot 0 are used as CODEC IO bits for I/O reads and writes to the CODEC registers as described in the next section. In this way, data streams of differing sample rate can be transmitted across AC-link at its fixed 48kHz audio frame rate.

### Slot 1: Command Address Port

In slot 1, it communicates control register address and write/read command information to the AC97 controller. When software accesses the primary CODEC, the hardware configures the frame as follows :

- In slot 0, the valid bit for 1, 2 slots are set.
- In slot 1, bit 19 is set (read) or clear(write). Bits 18-12 (of slot 1) are configured to specify the index to the CODEC register. Others are filled with 0's(reserved).
- In slot 2, it configured with the data which is for writing because of output frame.

### Slot 2: Command Data Port

In slot 2, this is the write data with 16-bit resolution.([19:4] is valid data)

### Slot 3: PCM Playback Left channel

Slot 3 which is audio output frame is the composite digital audio left stream. If a sample has a resolution that is less than 16 bits, the AC97 controller fills all training non-valid bit positions in the slot with zeroes.

### Slot 4: PCM Playback Right channel

Slot 4 which is audio output frame is the composite digital audio right stream. If a sample has a resolution that is less than 16 bits, the AC97 controller fills all training non-valid bit positions in the slot with zeroes.

Figure 27-5. AC-link Output Frame

## 4.2 AC-LINK INPUT FRAME (SDATA\_IN)

### Slot 0: Tag Phase

In slot 0, the first bit is a bit (SDATA\_OUT, bit 15) that indicates whether the AC97 controller is in the CODEC ready state. If the CODEC Ready bit is a 0, the AC97 controller is not ready for normal operation. This condition is normal after the power is de-asserted on reset and the AC97 controller voltage references are settling.

### Slot 1: Status Address Port/SLOTREQ bits

The status port monitors the status for the AC97 controller functions including, but not limited to, mixer settings and power management. Audio input frame slot 1s stream echoes the control register index for the data to be returned in slot 2, if the controller tags slots 1 and 2 as valid during slot 0. The controller only accepts status data if the accompanying status address matches the last valid command address issued during the most recent read command. For multiple sample rate output, the CODEC examines its sample-rate control registers, its FIFOs' states, and the incoming SDATA\_OUT tag bits at the beginning of each audio output frame to determine which SLOTREQ bits to set active (low). SLOTREQ bits asserted during the current audio input frame indicate which output slots require data from the controller in the next audio output frame. For fixed 48 kHz operation, the SLOTREQ bits are set active (low), and a sample is transferred each frame. For multiple sample-rate input, the "tag" bit for each input slot indicates whether valid data is present.

**Table 27-1. Input Slot 1 Bit Definitions**

| Bit   | Description   |
|-------|---|
| 19    | RESERVED (Filled with zero)   |
| 18-12 | Control register index (Filled with zeroes if AC97 tags is invalid) |
| 11    | Slot 3 request : PCM Left channel                                   |
| 10    | Slot 4 request : PCM Right channel                                  |
| 9     | Slot 5 request : NA   |
| 8     | Slot 6 request : MIC channel  |
| 7     | Slot 7 request : NA   |
| 6     | Slot 8 request : NA   |
| 5     | Slot 9 request : NA   |
| 4     | Slot 10 request : NA  |
| 3     | Slot 11 request : NA  |
| 2     | Slot 12 request : NA  |
| 1, 0  | RESERVED (Filled with zero)   |

### Slot 2: Status Data Port

In slot 2, this is the status data with 16-bit resolution.([19:4] is valid data)

### Slot 3: PCM Record Left channel

Slot 3 which is audio input frame is the left channel audio output of the AC97 Codec. If a sample has a resolution that is less than 16 bits, the AC97 Codec fills all training non-valid bit positions in the slot with zeroes.

**Slot 4: PCM Right channel audio**

Slot 4 which is audio input frame is the right channel audio output of the AC97 Codec. If a sample has a resolution that is less than 16 bits, the AC97 Codec fills all training non-valid bit positions in the slot with zeroes.

**Slot 6: Microphone Record Data**

The AC97 Controller only supports 16-bit resolution for the MIC-in channel.

**Figure 27-6. AC-link Input Frame**

## 5 AC97 POWER-DOWN

For details, please refer the AC-Link Power Management part of AC97 revision 2.0 specification.

**Figure 27-7. AC97 Power-down Timing**

### 5.1.1 Powering Down the AC-link

The AC-link signals enter a low power mode when the AC97 Codec Power-down register (0x26) bit PR4 is set to a 1 (by writing 0x1000). Then the Primary Codec drives both BITCLK and SDATA\_IN to a logic low voltage level. The sequence follows the timing diagram shown in Figure 27-7.

The AC97 Controller transmits the write to Power-down register (0x26) over the AC-link. Set up the AC97 Controller so that it does not transmit data to slots 3-12 when it writes to the Power-down register bit PR4 (data 0x1000), and it does not require the Codec to process other data when it receives a power down request. When the Codec processes the request it immediately transitions BITCLK and SDATA\_IN to a logic low level. The AC97 Controller drives SYNC and SDATA\_OUT to a logic low level after programming the AC\_GLBCTRL register.

### 5.1.2 Waking up the AC-link - Wake Up Triggered by the AC97 Controller

AC-link protocol provides for a cold AC97 reset and a warm AC97 reset. The current power-down state ultimately dictates which AC97 reset is used. Registers must stay in the same state during all power-down modes unless a cold AC97 reset is performed. In a cold AC97 reset, the AC97 registers are initialized to their default values. After a power down, the AC-link must wait for a minimum of four audio frame times after the frame in which the power down occurred before it can be reactivated by reasserting the SYNC signal. When AC-link powers up, it indicates readiness through the Codec ready bit (input slot 0, bit 15).

## 6 CODEC RESET

For details, please refer the CODEC Reset part of AC97 revision 2.0 specification.

### 6.1.1 Cold AC97 Reset

A cold reset is generated when the nRESET pin is asserted through the AC\_GLBCTRL. Asserting and deasserting nRESET activates BITCLK and SDATA\_OUT. All AC97 control registers are initialized to their default power on reset values. nRESET is an asynchronous AC97 input.

### 6.1.2 Warm AC97 Reset

A Warm AC97 reset reactivates the AC-link without altering the current AC97 register values. A warm reset is generated when BITCLK is absent and SYNC is driven high. In normal audio frames, SYNC is a synchronous AC97 input. When BITCLK is absent, SYNC is treated as an asynchronous input used to generate a warm reset to AC97. The AC97 Controller must not activate BITCLK until it samples SYNC low again. This prevents a new audio frame from being falsely detected.

7 AC97 CONTROLLER STATE DIAGRAM

Figure 27-9. AC97 State Diagram

This is the state diagram of AC97 controller. It is helpful to understand AC97 controller state machine. State above figure is synchronized by peripheral clock (PCLK). It is able to monitor state at AC\_GLBSTAT register.

## 8 AC97 CONTROLLER SPECIAL REGISTERS

### 8.1 AC97 SPECIAL FUNCION REGISTER SUMMARY

| Register      | Address    | R/W | Description                                   | Reset Value |
|---------------|------------|-----|---|-------------|
| AC_GLBCTRL    | 0x5B000000 | R/W | AC97 Global Control Register                  | 0x00000000  |
| AC_GLBSTAT    | 0x5B000004 | R   | AC97 Global Status Register                   | 0x00000001  |
| AC_CODEC_CMD  | 0x5B000008 | R/W | AC97 Codec Command Register                   | 0x00000000  |
| AC_CODEC_STAT | 0x5B00000C | R   | AC97 Codec Status Register                    | 0x00000000  |
| AC_PCMADDR    | 0x5B000010 | R   | AC97 PCM Out/In Channel FIFO Address Register | 0x00000000  |
| AC_MICADDR    | 0x5B000014 | R   | AC97 MIC In Channel FIFO Address Register     | 0x00000000  |
| AC_PCMDATA    | 0x5B000018 | R/W | AC97 PCM Out/In Channel FIFO Data Register    | 0x00000000  |
| AC_MICDATA    | 0x5B00001C | R   | AC97 MIC In Channel FIFO Data Register        | 0x00000000  |

## 8.2 AC97 GLOBAL CONTROL REGISTER (AC\_GLBCTRL)

This is the global register of the AC97 controller. There are interrupt control registers, DMA control registers, AC-Link control register, data transmission control register and related reset control register.

| Register   | Address    | R/W | Description                  | Reset Value |
|------------|------------|-----|------------------------------|-------------|
| AC_GLBCTRL | 0x5B000000 | R/W | AC97 Global Control Register | 0x000000    |

| AC_GLBCTRL                                 | Bit     | Description  | Initial State |
|--|---------|--|---------------|
| -  | [31:23] | Reserved.  | 0             |
| Codec ready interrupt enable               | [22]    | 0 = Disable<br>1 = Enable  | 0             |
| PCM out channel underrun interrupt enable  | [21]    | 0 = Disable<br>1 = Enable ( FIFO is empty)                               | 0             |
| PCM in channel overrun interrupt enable    | [20]    | 0 = Disable<br>1 = Enable ( FIFO is full)                                | 0             |
| Mic in channel overrun interrupt enable    | [19]    | 0 = Disable<br>1 = Enable ( FIFO is full)                                | 0             |
| PCM out channel threshold interrupt enable | [18]    | 0 = Disable<br>1 = Enable ( FIFO is half empty)                          | 0             |
| PCM in channel threshold interrupt enable  | [17]    | 0 = Disable<br>1 = Enable ( FIFO is half full)                           | 0             |
| MIC in channel threshold interrupt enable  | [16]    | 0 = Disable<br>1 = Enable ( FIFO is half full)                           | 0             |
| -  | [15:14] | Reserved.  | 00            |
| PCM out channel transfer mode              | [13:12] | 00 = Off    01 = PIO    10 = DMA    11 = Reserved                        | 00            |
| PCM in channel transfer mode               | [11:10] | 00 = Off    01 = PIO    10 = DMA    11 = Reserved                        | 00            |
| MIC in channel transfer mode               | [9:8]   | 00 = Off    01 = PIO    10 = DMA    11 = Reserved                        | 00            |
| -  | [7:4]   | Reserved.  | 0000          |
| Transfer data enable using AC-link         | [3]     | 0 = Disable                    1 = Enable                                | 0             |
| AC-Link on                                 | [2]     | 0 = Off<br>1 = SYNC signal transfer to Codec                             | 0             |
| Warm reset                                 | [1]     | 0 = Normal<br>1 = Wake up codec from power down                          | 0             |
| Cold reset                                 | [0]     | 0 = Normal (note 2)<br>1 = Reset Codec and Controller Registers (note 1) | 0             |

### NOTES:

1. During Cold reset, writing to any AC97 Registers will not be affected.
2. When recovering from Cold reset, writing to any AC97 Registers will not be affected.  
Example: For consecutive Cold reset and Warm reset, first set AC\_GLBCTRL=0x1 then set AC\_GLBCTRL=0x0.  
After recovering from cold reset set AC\_GLBCTRL=0x2 then AC\_GLBCTRL=0x0.

### 8.3 AC97 GLOBAL STATUS REGISTER (AC\_GLBSTAT)

This is the status register. When the interrupt is occurred, you can check what the interrupt source is.

| Register   | Address    | R/W | Description                 | Reset Value |
|------------|------------|-----|-----------------------------|-------------|
| AC_GLBSTAT | 0x5B000004 | R   | AC97 Global Status Register | 0x00000001  |

| AC_GLBSTAT                          | Bit     | Description                |                        |                           | Initial State |
|-------------------------------------|---------|----------------------------|------------------------|---------------------------|---------------|
| -                                   | [31:23] | Reserved.                  |                        |                           | 0x00          |
| Codec ready interrupt               | [22]    | 0 = Not requested          | 1 = Requested          |                           | 0             |
| PCM out channel underrun interrupt  | [21]    | 0 = Not requested          | 1 = Requested          |                           | 0             |
| PCM in channel overrun interrupt    | [20]    | 0 = Not requested          | 1 = Requested          |                           | 0             |
| MIC in channel overrun interrupt    | [19]    | 0 = Not requested          | 1 = Requested          |                           | 0             |
| PCM out channel threshold interrupt | [18]    | 0 = Not requested          | 1 = Requested          |                           | 0             |
| PCM in channel threshold interrupt  | [17]    | 0 = Not requested          | 1 = Requested          |                           | 0             |
| MIC in channel threshold interrupt  | [16]    | 0 = Not requested          | 1 = Requested          |                           | 0             |
| -                                   | [15:3]  | Reserved.                  |                        |                           | 0x000         |
| Controller main state               | [2:0]   | 000 = Idle<br>011 = Active | 001 = Init<br>100 = LP | 010 = Ready<br>101 = Warm | 001           |

### 8.4 AC97 CODEC COMMAND REGISTER (AC\_CODEC\_CMD)

When you control writing or reading, you must set the Read enable bit, If you want to write data to the AC97 Codec, you set the index(or address) of the AC97 Codec and data.

| Register     | Address    | R/W | Description                 | Reset Value |
|--------------|------------|-----|-----------------------------|-------------|
| AC_CODEC_CMD | 0x5B000008 | R/W | AC97 Codec Command Register | 0x00000000  |

| AC_CODEC_CMD | Bit     | Description  |  |  | Initial State |
|--------------|---------|--|--|--|---------------|
| -            | [31:24] | Reserved   |  |  | 0x00          |
| Read enable  | [23]    | 0 = Command write <sup>(note)</sup><br>1 = Status read |  |  | 0             |
| Address      | [22:16] | Codec command address                                  |  |  | 0x00          |
| Data         | [15:0]  | Codec command data                                     |  |  | 0x0000        |

**NOTE:** When the commands are written on the AC\_CODEC\_CMD register, It is recommended that the delay time between the command and the next command is more than 1 / 48kHz.

### 8.5 AC97 CODEC STATUS REGISTER (AC\_CODEC\_STAT)

If the Read enable bit is 1 and Codec command address is valid, Codec status data is also valid.

| Register      | Address    | R/W | Description                | Reset Value |
|---------------|------------|-----|----------------------------|-------------|
| AC_CODEC_STAT | 0x5B00000C | R   | AC97 Codec Status Register | 0x00000000  |

| AC_CODEC_STAT | Bit     | Description          | Initial State |
|---------------|---------|----------------------|---------------|
| -             | [31:23] | Reserved.            | 0x00          |
| Address       | [22:16] | Codec status address | 0x00          |
| Data          | [15:0]  | Codec status data    | 0x0000        |

**NOTES:** If you want to read data from AC97 codec register via the AC\_CODEC\_STAT register, you should follow the steps.

1. Write command address and data on the AC\_CODEC\_CMD register with Bit[23] =1.
2. Have a delay time.
3. Read command address and data from AC\_CODEC\_STAT register.

### 8.6 AC97 PCM OUT/IN CHANNEL FIFO ADDRESS REGISTER (AC\_PCMADDR)

To index the internal PCM FIFOs address.

| Register   | Address    | R/W | Description                                   | Reset Value |
|------------|------------|-----|---|-------------|
| AC_PCMADDR | 0x5B000010 | R   | AC97 PCM Out/In Channel FIFO Address Register | 0x00000000  |

| AC_PCMADDR        | Bit     | Description                        | Initial State |
|-------------------|---------|------------------------------------|---------------|
| -                 | [31:28] | Reserved.                          | 0000          |
| Out read address  | [27:24] | PCM out channel FIFO read address  | 0000          |
| -                 | [23:20] | Reserved.                          | 0000          |
| In read address   | [19:16] | PCM in channel FIFO read address   | 0000          |
| -                 | [15:12] | Reserved.                          | 0000          |
| Out write address | [11:8]  | PCM out channel FIFO write address | 0000          |
| -                 | [7:4]   | Reserved.                          | 0000          |
| In write address  | [3:0]   | PCM in channel FIFO write address  | 0000          |

### 8.7 AC97 MIC IN CHANNEL FIFO ADDRESS REGISTER (AC\_MICADDR)

To index the internal MIC-in FIFO address.

| Register   | Address    | R/W | Description                               | Reset Value |
|------------|------------|-----|---|-------------|
| AC_MICADDR | 0x5B000014 | R   | AC97 MIC In Channel FIFO Address Register | 0x00000000  |

| AC_MICADDR    | Bit     | Description                       | Initial State |
|---------------|---------|-----------------------------------|---------------|
| -             | [31:20] | Reserved.                         | 0000          |
| Read address  | [19:16] | MIC in channel FIFO read address  | 0000          |
| -             | [15:4]  | Reserved.                         | 0x000         |
| Write address | [3:0]   | MIC in channel FIFO write address | 0000          |

### 8.8 AC97 PCM OUT/IN CHANNEL FIFO DATA REGISTER (AC\_PCMDATA)

This is PCM out/in channel FIFO data register.

| Register   | Address    | R/W | Description                                | Reset Value |
|------------|------------|-----|--|-------------|
| AC_PCMDATA | 0x5B000018 | R/W | AC97 PCM Out/In Channel FIFO Data Register | 0x00000000  |

| AC_PCMDATA | Bit     | Description  | Initial State |
|------------|---------|--|---------------|
| Right data | [31:16] | PCM out/in right channel FIFO data<br>Read = PCM in right channel<br>Write = PCM out right channel | 0x0000        |
| Left data  | [15:0]  | PCM out/in left channel FIFO data<br>Read = PCM in left channel<br>Write = PCM out left channel    | 0x0000        |

### 8.9 AC97 MIC IN CHANNEL FIFO DATA REGISTER (AC\_MICDATA)

This is MIC-in channel FIFO data register.

| Register   | Address    | R/W | Description                            | Reset Value |
|------------|------------|-----|--|-------------|
| AC_MICDATA | 0x5B00001C | R   | AC97 MIC In Channel FIFO Data Register | 0x00000000  |

| AC_MICDATA | Bit     | Description                   | Initial State |
|------------|---------|-------------------------------|---------------|
| -          | [31:16] | Reserved                      | 0x0000        |
| Mono data  | [15:0]  | MIC in mono channel FIFO data | 0x0000        |

# 28

## PCM AUDIO INTERFACE

### 1 OVERVIEW

The S3C2451 has two ports of PCM Audio Interface. The PCM Audio Interface module provides PCM bi-directional serial interface to an external Codec.

#### 1.1 FEATURE

- Mono, 16bit PCM, 2 ports audio interface.
- Master mode only, this block always sources the main serial clock
- The sources of PCM clock are based on an internal PCLK or an External Clock
- Input (16bit 32depth) and output(16bit 32depth) FIFOs to buffer data
- DMA interface for Tx and/or Rx

#### 1.2 SIGNALS

| Name                     | Direction | Description                            |
|--------------------------|-----------|--|
| PCM0_SCLK<br>PCM1_SCLK   | Output    | Serial shift clock                     |
| PCM0_FSYNC<br>PCM1_FSYNC | Output    | Serial data indicator and synchronizer |
| PCM0_SDI<br>PCM1_SDI     | Output    | Serial PCM input data                  |
| PCM0_SDO<br>PCM1_SDO     | Output    | Serial PCM output data                 |
| PCM0_CDCLK<br>PCM1_CDCLK | Input     | Optional External Clock source         |

## 2 PCM AUDIO INTERFACE

The PCM Audio Interface provides a serial interface to an external Codec. The PCM module receives an input PCMSOURCE\_CLK that is used to generate the serial shift timing. The PCM interface outputs a serial data out, a serial shift clock, and a sync signal. Data is received from the external Codec over a serial input line. All the serial data in, serial data out, and sync signal are synchronized to the serial shift clock.

The serial shift clock, PCMSCLK, is generated from a programmable divide of the input PCMSOURCE\_CLK. The sync signal, PCMFSYNC, is generated based upon a programmable number of serial clocks and is one serial data clock wide.

The PCM data words are 16-bits wide and serially shifted out 1-bit per PCMSCLK. Only one 16-bit word is shifted out for each PCMFSYNC. The PCMSCLK will continue to toggle even after all 16-bits have been shifted out. The PCMSOUT data will be a undefined after the 16-bit word has completed. The next PCMFSYNC will signal the start of the next PCM data word.

The TX FIFO provides the 16-bit data word to be serially shifted out. This data is serially shifted out MSB first, one bit per PCMSCLK. The PCM serial output data, PCMSOUT, is clocked out using the rising edge of the PCMSCLK. The MSB bit position relative to the PCMFSYNC is programmable to be either coincident with the PCMFSYNC or one PCMSCLK later. After all 16-bits have been shifted out, an interrupt can optionally be generated indicating the end of the transfer.

When the data is being shifted out, the PCMSIN input is used to serially shift data in from the external codec. The data is received MSB first and is clocked in the falling edge of PCMSCLK. The position of the first bit is programmable to be coincident with the PCMFSYNC or one PCMSCLK later.

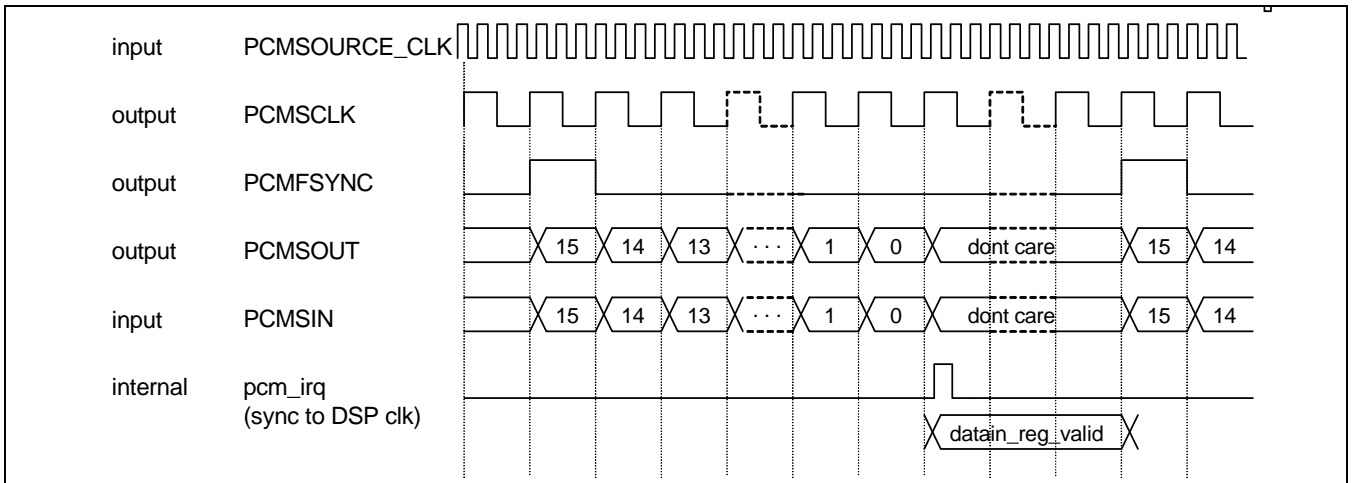

The first 16-bits are serially shifted into the PCM\_DATAIN register which is later loaded into the RX FIFO. Subsequent bits are ignored until the next PCMFSYNC.

Various Interrupts are available to indicate the status of the RX and TX FIFO. Each FIFO has a programmable flag to indicate when the CPU needs to service the FIFO. For the RX FIFO there is an interrupt which will be raised when the FIFO exceeds a certain programmable almost\_full depth. Similarly there is a programmable almost\_empty interrupt for the TX FIFO.

### 3 PCM TIMING

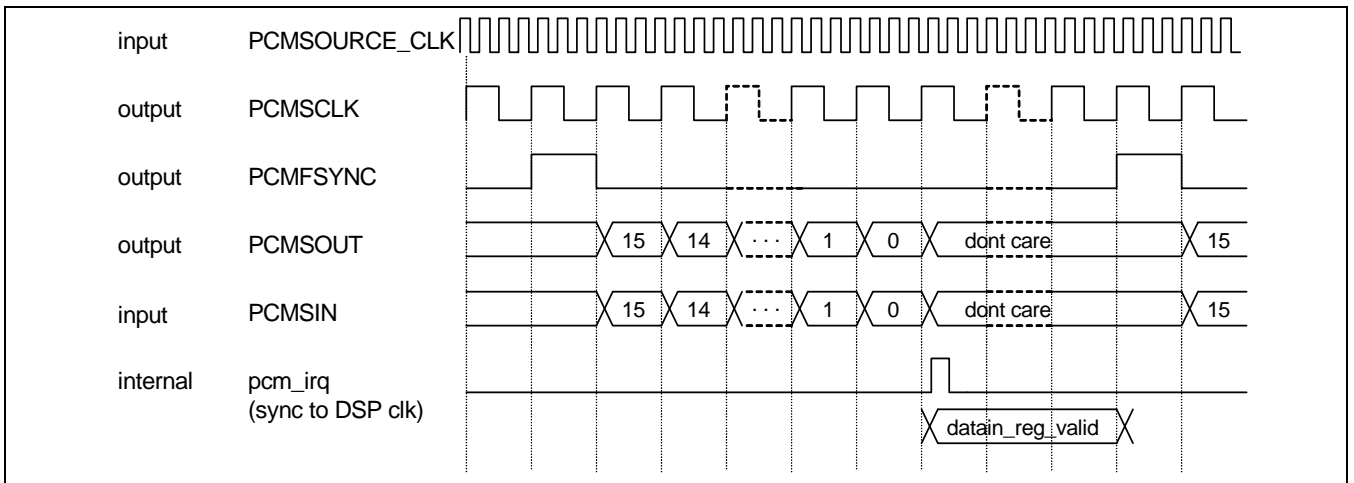

The following figures show the timing relationship for the PCM transfers.

Figure 28-1 shows a PCM transfer with the MSB configured to be coincident with the PCMFSSYNC. This MSB positioning corresponds to setting the TX\_MSB\_POS and RX\_MSB\_POS bits in PCMCTL register to be 0.

**Figure 28-1. PCM timing, TX\_MSB\_POS / RX\_MSB\_POS = 0**

Figure 28-2 shows a PCM transfer with the MSB configured one shift clock after the PCMFSSYNC. This MSB positioning corresponds to setting the TX\_MSB\_POS and RX\_MSB\_POS bits in PCMCTL register to be 1.

**Figure 28-2. PCM timing, TX\_MSB\_POS / RX\_MSB\_POS = 1**

**NOTE**

In all cases, the PCM shift timing is derived by dividing the input clock, PCMSOURCE\_CLK. While the timing is based upon the PCMSOURCE\_CLK, there is no attempt to realign the rising edge of the output PCMSCLK with the original PCMSOURCE\_CLK input clock. These edges will be skewed by internal delay through the pads as well as the divider logic. This does not represent a problem because the actual shift clock, PCMSCLK, is output with the data. Furthermore, even if the PCMSCLK output is not used, the skew will be significantly less than the period of the PCMSOURCE\_CLK and should not represent a problem since most PCM interfaces capture data on the falling edge of the clock.

## 3.1 PCM INPUT CLOCK DIAGRAM

Figure 28-3. Input Clock Diagram for PCM

S3C2451 PCM is able to select clock either PCLK or External Clock. Refer figure 28-3. To enable clock gating, please refer to the SYSCON part(SCLKCON, PCLKCON).

### 3.2 PCM REGISTERS

There are 8 control registers for each PCM port. (Since there are two ports, the total number of control registers is 16.) The number(0 or 1) that follows each register name indicates which PCM module this register belongs to. The details of those registers are as follows.

### 3.3 PCM REGISTER SUMMARY

| Register       | Address    | R/W | Description                  | Reset Value |
|----------------|------------|-----|------------------------------|-------------|
| PCM_CTL0       | 0x5C000000 | R/W | PCM0 Main Control            | 0x00000000  |
| PCM_CTL1       | 0x5C000100 | R/W | PCM1 Main Control            | 0x00000000  |
| PCM_CLKCTL0    | 0x5C000004 | R/W | PCM0 Clock and Shift control | 0x00000000  |
| PCM_CLKCTL1    | 0x5C000104 | R/W | PCM1 Clock and Shift control | 0x00000000  |
| PCM_TXFIFO0    | 0x5C000008 | R/W | PCM0 TxFIFO write port       | 0x00010000  |
| PCM_TXFIFO1    | 0x5C000108 | R/W | PCM1 TxFIFO write port       | 0x00010000  |
| PCM_RXFIFO0    | 0x5C00000C | R/W | PCM0 RxFIFO read port        | 0x00010000  |
| PCM_RXFIFO1    | 0x5C00010C | R/W | PCM1 RxFIFO read port        | 0x00010000  |
| PCM_IRQ_CTL0   | 0x5C000010 | R/W | PCM0 Interrupt Control       | 0x00000000  |
| PCM_IRQ_CTL1   | 0x5C000110 | R/W | PCM1 Interrupt Control       | 0x00000000  |
| PCM_IRQ_STAT0  | 0x5C000014 | R   | PCM0 Interrupt Status        | 0x00000000  |
| PCM_IRQ_STAT1  | 0x5C000114 | R   | PCM1 Interrupt Status        | 0x00000000  |
| PCM_FIFO_STAT0 | 0x5C000018 | R   | PCM0 FIFO Status             | 0x00000000  |
| PCM_FIFO_STAT1 | 0x5C000118 | R   | PCM1 FIFO Status             | 0x00000000  |
| PCM_CLRINT0    | 0x5C000020 | W   | PCM0 INTERRUPT CLEAR         | 0x00000000  |
| PCM_CLRINT1    | 0x5C000120 | W   | PCM1 INTERRUPT CLEAR         | 0x00000000  |

### 3.4 PCM CONTROL REGISTER

The PCM\_CTL register is used to control the various aspects of the PCM module. It also provides a status bit to provide the option to using polling instead of interrupt based control.

| Register | Address    | R/W | Description                      | Reset Value |
|----------|------------|-----|----------------------------------|-------------|
| PCM_CTL0 | 0x5C000000 | R/W | Control the PCM0 Audio Interface | 0x00000000  |
| PCM_CTL1 | 0x5C000100 | R/W | Control the PCM1 Audio Interface | 0x00000000  |

The bit definitions for the PCM\_CTL Control Register are shown below:

| PCM_CTLn        | Bit     | Description   | Initial State |
|-----------------|---------|---|---------------|
| Reserved        | [31:19] | Reserved  |               |
| TXFIFO_DIPSTICK | [18:13] | <p>Determines when the almost_full, almost_empty flags go active for the TXFIFO</p> <p>TXFIFO_ALMOST_EMPTY: <math>\text{txfifo\_depth} &lt; \text{txfifo\_dipstick}</math><br/> TXFIFO_ALMOST_FULL: <math>\text{txfifo\_depth} &gt; (32 - \text{txfifo\_dipstick})</math></p> <p><b>Note:</b></p> <ul style="list-style-type: none"> <li>- If txfifo_dipstick is 0, Almost_empty, Almost_full are invalid</li> <li>- For DMA loading of TX fifo, Txfifo_dipstick should be equal to 2 or greater than 2(<math>\text{txfifo\_dipstick} \geq 2</math>)</li> </ul> <p>This is required since the PCM_TXDMA uses TXFIFO_ALMOST_FULL as the DMA request (keep requesting data until the FIFO is almost full) In some circumstances, the DMA write one more word after the DMA_req goes away. Thus the almost_full flag must go active with at least space for one extra word in the fifo</p> | 0             |
| RXFIFO_DIPSTICK | [12:7]  | <p>Determines when the almost_full, almost_empty flags go active for the RXFIFO</p> <p>RXFIFO_ALMOST_EMPTY : <math>\text{fifo\_depth} &lt; \text{fifo\_dipstick}</math><br/> RXFIFO_ALMOST_FULL : <math>\text{fifo\_depth} &gt; (32 - \text{fifo\_dipstick})</math></p> <p><b>Note:</b></p> <ul style="list-style-type: none"> <li>- If fifo_dipstick is 0, Almost_empty, Almost_full are invalid.</li> <li>- For DMA, RXFIFO_DIPSTICK is a don't care.<br/>(DMA unloading of RX fifo uses the RXFIFO_EMPTY flag as the DMA request)</li> <li>- Non-DMA IRQ/polling RXFIFO_DIPSTICK should be 32.<br/>This will have the effect of RXFIFO_ALMOST_FULL acting as a rx_fifo_not_empty flag (as a not RXFIFO_EMPTY).</li> </ul>  | 0             |
| PCM_TX_DMA_EN   | [6]     | <p>Enable the DMA interface for the TXFIFO DMA must operate in the demand mode.</p> <p>DMA_TX request will occur whenever the TXFIFO is not almost full</p>   | 0             |
| PCM_RX_DMA_EN   | [5]     | <p>Enable the DMA interface for the RXFIFO DMA must operate in the demand mode.</p>   | 0             |

| PCM_CTLn       | Bit | Description   | Initial State |
|----------------|-----|---|---------------|
|                |     | DMA_RX request will occur whenever the RXFIFO is not empty.   |               |
| TX_MSB_POS     | [4] | Controls the position of the MSB bit in the serial output stream relative to the PCMFSYNC signal<br>0 = MSB sent during the same clock that PCMFSYNC is high<br>1 = MSB sent on the next PCMSCLK cycle after PCMFSYNC is high   | 0             |
| RX_MSB_POS     | [3] | Controls the position of the MSB bit in the serial input stream relative to the PCMFSYNC signal<br>0 = MSB is captured on the falling edge of PCMSCLK during the same cycle that PCMFSYNC is high<br>1 = MSB is captured on the falling edge of PCMSCLK during the cycle after the PCMFSYNC is high | 0             |
| PCM_TXFIFO_EN  | [2] | Enable the TXFIFO (note 1)  | 0             |
| PCM_RXFIFO_EN  | [1] | Enable the RXFIFO (note 1)  | 0             |
| PCM_PCM_ENABLE | [0] | PCM enable signal.<br>1 = Enables the serial shift state machines. (note 2)<br>The enable must be set HIGH for the PCM to operate.<br>0 = The PCMSOUT will not toggle.<br>The internal divider-counters (serial shift register's counter) are held in reset. (note 3)                               | 0             |

**NOTES:**

- To flush FIFO, first set PCM\_TX/RXFIFO\_EN = 0x0 then set PCM\_TX/RXFIFO\_EN = 0x1.
- To Start PCM operation please refer the following steps
  - PCM\_TXFIFO\_EN=0x1;
  - PCM\_TX\_DMA\_EN=0x1;
  - wait until fifo full
  - CTL\_SERCLK\_EN = 0x1;
  - PCM\_PCM\_ENABLE = 0x1;
- To pause PCM operation, with CTL\_SERCLK\_EN = 0x0, PCM\_PCM\_ENABLE bit should be set to zero.

## 3.5 PCM CLK CONTROL REGISTER

| Register    | Address    | R/W | Description                      | Reset Value |
|-------------|------------|-----|----------------------------------|-------------|
| PCM_CLKCTL0 | 0x5C000004 | R/W | Control the PCM0 Audio Interface | 0x00000000  |
| PCM_CLKCTL1 | 0x5C000104 | R/W | Control the PCM1 Audio Interface | 0x00000000  |

The bit definitions for the PCM\_CTL Control Register are shown below:

| PCM_CLKCTLn    | Bit     | Description  | Initial State |
|----------------|---------|--|---------------|
| Reserved       | [31:20] | Reserved   |               |
| CTL_SERCLK_EN  | [19]    | Enable the serial clock division logic.<br>Must be HIGH for the PCM to operate (if it is high, PCMSCLK and PCMFSYNC is operated.) 1)           | 0             |
| CTL_SERCLK_SEL | [18]    | Select the source of the PCMSOURCE_CLK<br>0 = External clock<br>1 = PCLK   | 0             |
| SCLK_DIV       | [17:9]  | Controls the divider used to create the PCMSCLK based on the PCMSOURCE_CLK. (1/2~1/1024) PCMSLCK will be $PCMSOURCE\_CLK / 2^{*(SCLK\_DIV+1)}$ | 000           |
| SYNC_DIV       | [8:0]   | Controls the frequency of the PCMFSYNC signal based on the PCMSCLK. (1/1~1/512)<br>Freq. of PCMFSYNC = Freq. of PCMSCLK/(SYNC_DIV+1)           | 000           |

**NOTE:** For correct functioning of PCM pause and continue, please refer following steps.

To Pause PCM operation, first set CTL\_SERCLK\_EN = 0x0, then set PCM\_PCM\_ENABLE =0x0.

To continue PCM operation, first set CTL\_SERCLK\_EN = 0x1, then set PCM\_PCM\_ENABLE =0x1.

### 3.6 THE PCM TX FIFO REGISTER

| Register    | Address    | R/W | Description                                | Reset Value |
|-------------|------------|-----|--|-------------|
| PCM_TXFIFO0 | 0x5C000008 | R/W | PCM0 interface Transmit FIFO data register | 0x00010000  |
| PCM_TXFIFO1 | 0x5C000108 | R/W | PCM1 interface Transmit FIFO data register | 0x00010000  |

The bit definitions for the PCM\_TXFIFO Register are shown below:

| PCM_TXFIFO <sub>n</sub> | Bit     | Description  | Initial State |
|-------------------------|---------|--|---------------|
| Reserved                | [31:17] | Reserved   |               |
| TXFIFO_DVALID           | [16]    | TXFIFO data is valid<br>Write: don't care<br>Read: TXFIFO read data valid<br>1 = Valid<br>0 = Invalid (probably read an empty fifo)                              | 1             |
| TXFIFO_DATA             | [15:0]  | Write: Write PCM data to TXFIFO<br><b>Note:</b> The TXFIFO is read by the PCM serial shift engine<br>Read: Read PCM data from TXFIFO for supporting debug TXFIFO | 0             |

## 3.7 PCM RX FIFO REGISTER

| Register    | Address    | R/W | Description                               | Reset Value |
|-------------|------------|-----|---|-------------|
| PCM_RXFIFO0 | 0x5C00000C | R/W | PCM0 interface Receive FIFO data register | 0x00010000  |
| PCM_RXFIFO1 | 0x5C00010C | R/W | PCM1 interface Receive FIFO data register | 0x00010000  |

The bit definitions for the PCM\_RXFIFO Register are shown below:

| PCM_RXFIFO <sub>n</sub> | Bit     | Description  | Initial State |
|-------------------------|---------|--|---------------|
| Reserved                | [31:17] | Reserved   |               |
| RXFIFO_DVALID           | [16]    | RXFIFO data is valid<br>Write: don't care<br>Read: TXFIFO read data valid<br>1 = Valid<br>0 = Invalid (probably read an empty fifo)                          | 1             |
| RXFIFO_DATA             | [15:0]  | Write: Write PCM data to RXFIFO for debugging RXFIFO<br>Read: Read PCM data from RXFIFO<br><b>Note:</b> The RXFIFO is written by the PCM serial shift engine | 0             |

### 3.8 PCM INTERRUPT CONTROL REGISTER

The PCM\_IRQ\_CTL register is used to control the various aspects of the PCM interrupts.

| Register     | Address    | R/W | Description                 | Reset Value |
|--------------|------------|-----|-----------------------------|-------------|
| PCM_IRQ_CTL0 | 0x5C000010 | R/W | Control the PCM0 Interrupts | 0x00000000  |
| PCM_IRQ_CTL1 | 0x5C000110 | R/W | Control the PCM1 Interrupts | 0x00000000  |

The bit definitions for the PCM\_IRQ\_CTL Control Register are shown below:

| PCM_IRQ_CTLn        | Bit     | Description  | Initial State |
|---------------------|---------|--|---------------|
| Reserved            | [31:15] | Reserved   |               |
| EN_IRQ_TO_ARM       | [14]    | Controls whether the PCM interrupt is sent to the ARM or not<br>1: PCM IRQ is forwarded to the ARM subsystem<br>0: PCM IRQ is NOT forwarded to the ARM subsystem         | 0             |
| Reserved            | [13]    | Reserved   | 0             |
| TRANSFER_DONE       | [12]    | Interrupt is generated every time the serial shift for a 16bit PCM Data word completes<br>1: IRQ source enabled<br>0: IRQ source disabled                                | 0             |
| TXFIFO_EMPTY        | [11]    | Interrupt is generated whenever the TxFIFO is empty<br>1: IRQ source enabled<br>0: IRQ source disabled   | 0             |
| TXFIFO_ALMOST_EMPTY | [10]    | Interrupt is generated whenever the TxFIFO is ALMOST_EMPTY which is defined as TX_FIFO_DEPTH < TX_FIFO_DIPSTICK<br>1: IRQ source enabled<br>0: IRQ source disabled       | 0             |
| TXFIFO_FULL         | [9]     | Interrupt is generated whenever the TxFIFO is full<br>1: IRQ source enabled<br>0: IRQ source disabled  | 0             |
| TXFIFO_ALMOST_FULL  | [8]     | Interrupt is generated whenever the TxFIFO is ALMOST_FULL which is defined as TX_FIFO_DEPTH > (32 - TX_FIFO_DIPSTICK)<br>1: IRQ source enabled<br>0: IRQ source disabled | 0             |

| PCM_IRQ_CTLn          | Bit | Description  | Initial State |
|-----------------------|-----|--|---------------|
| TXFIFO_ERROR_STARVE   | [7] | Interrupt is generated for TxFIFO starve ERROR.<br>This occurs whenever the TxFIFO is read when it is still empty. This is considered an ERROR and will have unexpected results<br>1: IRQ source enabled<br>0: IRQ source disabled       | 0             |
| TXFIFO_ERROR_OVERFLOW | [6] | Interrupt is generated for TxFIFO overflow ERROR.<br>This occurs whenever the TxFIFO is written when it is already full. This is considered an ERROR and will have unexpected results<br>1: IRQ source enabled<br>0: IRQ source disabled | 0             |
| RXFIFO_EMPTY          | [5] | Interrupt is generated whenever the RxFIFO is empty<br>1: IRQ source enabled<br>0: IRQ source disabled   | 0             |
| RXFIFO_ALMOST_EMPTY   | [4] | Interrupt is generated whenever the RxFIFO is ALMOST_EMPTY which is defined as $RX\_FIFO\_DEPTH < RX\_FIFO\_DIPSTICK$<br>1: IRQ source enabled<br>0: IRQ source disabled   | 0             |
| RX_FIFO_FULL          | [3] | Interrupt is generated whenever the RxFIFO is full<br>1: IRQ source enabled<br>0: IRQ source disabled  | 0             |
| RX_FIFO_ALMOST_FULL   | [2] | Interrupt is generated whenever the RxFIFO is ALMOST_FULL which is defined as $RX\_FIFO\_DEPTH > (32 - RX\_FIFO\_DIPSTICK)$<br>1: IRQ source enabled<br>0: IRQ source disabled   | 0             |
| RXFIFO_ERROR_STARVE   | [1] | Interrupt is generated for RxFIFO starve ERROR.<br>This occurs whenever the RxFIFO is read when it is still empty. This is considered an ERROR and will have unexpected results<br>1: IRQ source enabled<br>0: IRQ source disabled       | 0             |

---

| PCM_IRQ_CTLn              | Bit | Description  | Initial State |
|---------------------------|-----|--|---------------|
| RXFIFO_ERROR_<br>OVERFLOW | [0] | Interrupt is generated for RxFIFO overflow ERROR.<br>This occurs whenever the RxFIFO is written when it is already full. This is considered an ERROR and will have unexpected results<br>1: IRQ source enabled<br>0: IRQ source disabled | 0             |

### 3.9 PCM INTERRUPT STATUS REGISTER

The PCM\_IRQ\_STAT register is used to report IRQ status.

| Register      | Address    | R/W | Description           | Reset Value |
|---------------|------------|-----|-----------------------|-------------|
| PCM_IRQ_STAT0 | 0x5C000014 | R   | PCM0 Interrupt Status | 0x00000000  |
| PCM_IRQ_STAT1 | 0x5C000114 | R   | PCM1 Interrupt Status | 0x00000000  |

The bit definitions for the PCM\_IRQ\_STATUS Register are described below:

| PCM_IRQ_STATn       | Bit     | Description   | Initial State |
|---------------------|---------|---|---------------|
| Reserved            | [31:14] | Reserved  |               |
| IRQ_PENDING         | [13]    | Monitoring PCM IRQ.<br>1 = PCM IRQ is occurred.<br>0 = PCM IRQ is not occurred.   | 0             |
| TRANSFER_DONE       | [12]    | Interrupt is generated every time the serial shift for a word completes<br>1 = IRQ is occurred.<br>0 = IRQ is not occurred.   | 0             |
| TXFIFO_EMPTY        | [11]    | Interrupt is generated whenever the TX FIFO is empty<br>1 = IRQ is occurred.<br>0 = IRQ is not occurred.  | 0             |
| TXFIFO_ALMOST_EMPTY | [10]    | Interrupt is generated whenever the TxFIFO is ALMOST empty.<br>1 = IRQ is occurred.<br>0 = IRQ is not occurred.   | 0             |
| TXFIFO_FULL         | [9]     | Interrupt is generated whenever the TX FIFO is full<br>1 = IRQ is occurred.<br>0 = IRQ is not occurred.   | 0             |
| TXFIFO_ALMOST_FULL  | [8]     | Interrupt is generated whenever the TX FIFO is ALMOST full.<br>1 = IRQ is occurred.<br>0 = IRQ is not occurred.   | 0             |
| TXFIFO_ERROR_STARVE | [7]     | Interrupt is generated for TX FIFO starve ERROR.<br>This occurs whenever the TX FIFO is read when it is still empty.<br>This is considered as an ERROR and will have unexpected results<br>1 = IRQ is occurred.<br>0 = IRQ is not occurred. | 0             |

| PCM_IRQ_STATn         | Bit | Description  | Initial State |
|-----------------------|-----|--|---------------|
| TXFIFO_ERROR_OVERFLOW | [6] | Interrupt is generated for TX FIFO overflow ERROR.<br>This occurs whenever the TX FIFO is written when it is already full. This is considered as an ERROR and will have unexpected results<br><br>1 = IRQ is occurred.<br>0 = IRQ is not occurred. | 0             |
| RXFIFO_EMPTY          | [5] | Interrupt is generated whenever the RX FIFO is empty<br><br>1 = IRQ is occurred.<br>0 = IRQ is not occurred.   | 0             |
| RXFIFO_ALMOST_EMPTY   | [4] | Interrupt is generated whenever the RX FIFO is ALMOST empty.<br><br>1 = IRQ is occurred.<br>0 = IRQ is not occurred.   | 0             |
| RX_FIFO_FULL          | [3] | Interrupt is generated whenever the RX FIFO is full<br><br>1 = IRQ is occurred.<br>0 = IRQ is not occurred.  | 0             |
| RX_FIFO_ALMOST_FULL   | [2] | Interrupt is generated whenever the RX FIFO is ALMOST full.<br><br>1 = IRQ is occurred.<br>0 = IRQ is not occurred.  | 0             |
| RXFIFO_ERROR_STARVE   | [1] | Interrupt is generated for RX FIFO starve ERROR.<br>This occurs whenever the RX FIFO is read when it is still empty. This is considered as an ERROR and will have unexpected results<br><br>1 = IRQ is occurred.<br>0 = IRQ is not occurred.       | 0             |
| RXFIFO_ERROR_OVERFLOW | [0] | Interrupt is generated for RX FIFO overflow ERROR.<br>This occurs whenever the RX FIFO is written when it is already full. This is considered as an ERROR and will have unexpected results<br><br>1 = IRQ is occurred.<br>0 = IRQ is not occurred. | 0             |

**NOTE:** More than one interrupt sources(which was set by PCM\_IRQ\_CTL register) can cause interrupt, at same time(i.e, interrupt at PCM is OR-ed interrupt.) So in Interrupt Service Routine, user should check this register bits which you set as interrupt sources.

### 3.10 PCM FIFO STATUS REGISTER

The PCM\_FIFO\_STAT register is used to report FIFO status.

| Register       | Address    | R/W | Description      | Reset Value |
|----------------|------------|-----|------------------|-------------|
| PCM_FIFO_STAT0 | 0x5C000018 | R   | PCM0 FIFO Status | 0x00000000  |
| PCM_FIFO_STAT1 | 0x5C000118 | R   | PCM1 FIFO Status | 0x00000000  |

The bit definitions for the PCM\_FIFO\_STATUS Register are shown below:

| PCM_FIFO_STATn      | Bit     | Description  | Initial State |
|---------------------|---------|--|---------------|
| Reserved            | [31:20] | Reserved   |               |
| TXFIFO_COUNT        | [19:14] | TX FIFO data count(0 ~ 32).                                  | 0             |
| TXFIFO_EMPTY        | [13]    | 1 = TXFIFO is empty<br>0 = TXFIFO is not empty               | 0             |
| TXFIFO_ALMOST_EMPTY | [12]    | 1 = TXFIFO is ALMOST_EMPTY<br>0 = TXFIFO is not ALMOST_EMPTY | 0             |
| TXFIFO_FULL         | [11]    | 1 = TXFIFO is full<br>0 = TXFIFO is not full                 | 0             |
| TXFIFO_ALMOST_FULL  | [10]    | 1 = TXFIFO is ALMOST_FULL<br>0 = TXFIFO is not ALMOST_FULL   | 0             |
| RXFIFO_COUNT        | [9:4]   | RX FIFO data count(0 ~ 32).                                  |               |
| RXFIFO_EMPTY        | [3]     | 1 = RXFIFO is empty<br>0 = RXFIFO is not empty               | 0             |
| RXFIFO_ALMOST_EMPTY | [2]     | 1 = RXFIFO is ALMOST_EMPTY<br>0 = RXFIFO is not ALMOST_EMPTY | 0             |
| RX_FIFO_FULL        | [1]     | 1 = RXFIFO is full<br>0 = RXFIFO is not full                 | 0             |
| RX_FIFO_ALMOST_FULL | [0]     | 1 = RXFIFO is ALMOST_FULL<br>0 = RXFIFO is not ALMOST_FULL   | 0             |

### 3.11 PCM INTERRUPT CLEAR REGISTER

The PCM\_CLRINT register is used to clear the interrupt. Interrupt service routine is responsible for clearing interrupt asserted. Writing any values on this register clears interrupts for ARM. Reading this register is not allowed. Clearing interrupt must be prior to resolving the interrupt condition, otherwise another interrupt that would occur after this interrupt may be ignored.

| Register    | Address    | R/W | Description          | Reset Value |
|-------------|------------|-----|----------------------|-------------|
| PCM_CLRINT0 | 0x5C000020 | W   | PCM0 INTERRUPT CLEAR | -           |
| PCM_CLRINT1 | 0x5C000120 | W   | PCM1 INTERRUPT CLEAR |             |

The bit definitions for the PCM\_CLRINT Register are shown below:

| PCM_CLRINTn | Bit    | Description              | Initial State |
|-------------|--------|--------------------------|---------------|
| Reserved    | [31:1] | Reserved                 | 0             |
| CLRINT      | [0]    | Interrupt register clear | 0             |

**NOTES:** Std. means Standard Mode and fast means Fast Mode.

- The IIC data hold time(t<sub>SDAH</sub>) is minimum 0ns.  
(IIC data hold time is minimum 0ns for standard/fast bus mode in IIC specification v2.1.)  
Please check the data hold time of your IIC device if it's 0 nS or not.
- The IIC controller supports only IIC bus device(standard/fast bus mode), not C bus device.
